

MEETING
STATE OF CALIFORNIA
DEPARTMENT OF TOXIC SUBSTANCES CONTROL

GREEN RIBBON SCIENCE PANEL

CalEPA HEADQUARTERS BUILDING
CONFERENCE ROOM 550, 5TH FLOOR
1001 I STREET
SACRAMENTO, CALIFORNIA 95814

WEDNESDAY, APRIL 24, 2019

8:00 A.M.

Reported by:
Peter Petty

APPEARANCES

PANEL MEMBERS PRESENT

Kelly D. Moran, Ph.D., Co-Chair

Arthur Fong, Ph.D., Co-Chair

Ann Blake, Ph.D.

Michael Caringello, MBA

Elaine Cohen-Hubal, PhD

Jack Linard, Ph.D.

Rebecca Sutton, Ph.D.

Ken Zarker

DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC)

Meredith Williams, Ph.D., Acting Director

Karl Palmer, Acting Deputy Director

Kerry Rasmussen

Xiaoying Zhou

Anne Cooper Doherty

Tony Luan

Michelle Romero-Fishback

Kelly Grant

Anna Gross

PRESENTERS/SPEAKERS

Jared Blumenfeld, Secretary, Cal/EPA

Xiaoying Zhou, Ph.D., P.E., Senior Hazardous Substances
Engineer,
Safer Products and Workplaces Program

Dr. Margaret Whittaker of ToxServices LLC

PUBLIC COMMENT

Kraig Kurucz, Lockheed Martin Space Systems

Brian Penttila, Washington State Department of Ecology
(Statement read into the record.)

AGENDA

	<u>Page</u>
Morning	
1. Welcome, Opening Remarks and Agenda Review	5
2. Public Comment	16
3. Presentation on Alternatives Analysis Review Process and Discussion	
• SCP Alternatives Analysis Review: Xiaoying Zhou	20
• Tips and Tricks for Review of AAs	36
<p>Dr. Margaret Whittaker of ToxServices LLC will present on her lessons learned in evaluating alternatives assessments. Dr. Whittaker and the Panel will discuss recommendations for DTSC in their upcoming evaluation of the first Alternatives Analyses submitted per the SCP regulations.</p> <ul style="list-style-type: none">- Pertinent Sections of the Safer Consumer Product Regulations and FSOR- Guest Speaker Profile for Dr. Margaret Whittaker- Two Stage AA Overview- Priority Product Profile - Paint or Varnish Stripper- Priority Product Profile - SPF with Unreacted MDI	
4. Conclude and Adjourn	136
Adjournment	142
Transcriber's Certificate	143

P R O C E E D I N G S

8:03 A.M.

MS. RASMUSSEN: Good morning everyone and welcome to day two of DTSC's Green Science Panel Meeting. My name is Kerry Rasmussen and I'm DTSC's or Department of Toxic Substances' Public Participation Representative. On behalf of the Department I'd like to thank you all for taking the time to be here today.

Let me take this moment to announce that in addition to those of us here in the room today the public is following us via the webcast. If you are tuning in to the discussion via the webcast, and you'd like to provide input, please email your questions and comments to SaferConsumerProducts@dtsc.ca.gov.

Today's meeting is also being recorded and transcripts will be posted to the DTSC's public website once they are made available to the Department.

A short evacuation announcement. In case of emergency please notice the two exit doors are over here with the lit exit signs above them. We hope that's not the case, but if we do need to evacuate please bring your valuables with you. Our staff will work to guide you to the nearest exit. If we need to leave the floor, please do not use the elevators, use the stairways instead. And if we need to leave the building, we'll be evacuating to

1 the Cesar Chavez Park across the street.

2 A few housekeeping details. The restrooms, the
3 women's restroom is all the way down either hallway. The
4 men's restroom is directly outside the door to the left.
5 The water fountains are near the women's restroom.

6 Public comments. We will be providing an
7 opportunity for public comments later this morning. We
8 ask that anyone who is interested in providing a public
9 comment please hand your public comment card in when you
10 are ready. For those of you who are tuning in remotely
11 you may email your comment to
12 SaferConsumerProducts@dtsc.ca.gov and it will be read
13 aloud.

14 Finally, I want to announce that all attendees
15 at today's Green Ribbon Science Panel, you are subject to
16 the Bagley-Keene Open Meeting Act to preserve public
17 transparency and the panel's discussion and decisions.

18 I'd now like to turn it over to Dr. Meredith
19 Williams, Acting Director of the Department of Toxic
20 Substances Control for the opening remarks.

21 ACTING DIRECTOR WILLIAMS: Thank you, Kerry.

22 And as you can see, I've brought someone with
23 me. And therefore I really don't intend -- nope. (Off
24 mic colloquy, laughter.) And I brought the Secretary,
25 this is Secretary Jared Blumenfeld as many of you already

1 know. I know a lot of you have interacted with him in
2 his role at either the San Francisco Department of the
3 Environment or USEPA Region IX as Administrator there and
4 we are incredibly fortunate to have him at the helm of
5 CalEPA.

6 Number one, to have someone walk in with that
7 wealth of experience has been tremendously beneficial.
8 And I, from the most the selfish view possible, it's been
9 fantastic just because he came in with a deep knowledge
10 of the Department, a deep knowledge of what our
11 challenges are, and what our opportunities are. And I
12 think it's fair to say that Safer Consumer Products is
13 one of those opportunities.

14 And he was kind enough to take a few minutes
15 before he heads downstairs to the throngs of kids to
16 inspire them about Earth Day and environmental
17 protection. But he has a few minutes, so I thought he
18 could share a few thoughts. So thank you, Jared, for
19 making the time for us.

20 SECRETARY BLUMENFELD: Of course. And thanks
21 to all of you, thanks particularly to the Co-Chairs, but
22 all the members of the Green Ribbon Panel and to everyone
23 in the room.

24 Just to give you a sense, I think, of how
25 important this panel is to me and to the Administration

1 when you think about kind of where we are in 2019 as a
2 country or as a state, the preeminence and importance of
3 putting science first is something I think California
4 represents. Often, science as an institution has been
5 eroded. The use of science in policy-making has often
6 been short-circuited. So to have a Green Ribbon Panel
7 that really is focusing on a different direction is
8 incredibly important, just incredibly important. And
9 incredibly important to me, DTSC, CalEPA and the
10 Governor. So I really want to thank you for, I know
11 often that you come a long way for these meetings and I
12 just want to let you know that we really thank you and
13 acknowledge the work that you do.

14 When it comes to safer consumer products, we
15 all assume that all of our consumer products are safe.
16 So I think we all start with this misguided sense of
17 safety, and even probably a sense of what we can attain
18 in terms of safety.

19 I spent a lot of time when I was in San
20 Francisco and Gavin Newsom was the Mayor thinking about
21 procurement; thinking about how to come up with a better
22 way of purchasing; how cities, states, government can
23 play a role to lead the way to show what can be done when
24 it comes to safer consumer products. We have a long way
25 to go, a very long way to go. And part of that is really

1 showing people what's possible, which is what you do.

2 Because I think people, you know, as our former
3 Governor and President Reagan said, "We have to trust,
4 but verify." People want to trust in a product, but you
5 help them verify that the process that we go through has
6 integrity. And I think integrity is something that we
7 all need to bolster in a time when people have lost faith
8 in government, have lost faith in institutions that they
9 used to be able to rely upon.

10 So explaining as you do, "This is how we're
11 thinking about an issue. This is how we're going to move
12 forward in discussions with manufacturers. This is how
13 we think about Alternatives Analysis," really does shift
14 that whole perspective about how we look at risk as an
15 agency.

16 And certainly, I was having a discussion
17 yesterday with folks about how pesticides are evaluated
18 and how we do a risk assessment and risk management. And
19 really the model that you are bringing to the table is
20 the one that I think we need to replicate. How do we
21 think about alternative analysis? How do we push
22 alternatives so that they're viable, quicker in the
23 marketplace? How do we, in some cases, cut the
24 regulatory bureaucracy and red tape for things that
25 plainly don't need certain risk thresholds.

1 So I really think that what you're doing has an
2 expansive role outside this room and outside these
3 particular issues. And hopefully it will be a model for
4 many, many others as they engage in a similar process, so
5 mainly just thank you.

6 And as much as Meredith said kind words about
7 me, I just want to apologize for stealing her from you.
8 You have Karl, but I have Meredith. (Laughter.) So I'm
9 grateful that Meredith accepted the offer to come on and
10 really help shape the agency. And I think much of what
11 she's doing is very much informed by the process and
12 engagement that she's had with you. So she's awesome, as
13 you know, and I'm really thankful that I get to work with
14 her every day. So thank you.

15 And I don't know if there's any questions? I'm
16 happy to answer any. You've already got pictures?
17 (Laughter.)

18 Kelly?

19 PANEL CO-CHAIR MORAN: What's your vision for
20 the program? What's your vision, going forward for Safer
21 Consumer Products?

22 SECRETARY BLUMENFELD: Well, I think there's
23 opportunities as we saw in the analysis that was done and
24 released a few months ago, just to think about how we
25 streamline. And I think that there's always

1 opportunities to kind of take those -- I think it was a
2 constructive criticism -- and really look at are there
3 opportunities to think about how we accelerate some of
4 the work?

5 I think the challenge that you have is that
6 people want what you're doing and want it more and
7 quicker. And often that is hard to achieve with the
8 staff and resources that we have. And so really thinking
9 about what does the scale of this project look like ten
10 years from now? How do we meet the demand for this
11 exercise? Because even with the range, I love reading
12 the range online of how many chemicals are in production
13 on the planet. It goes from 80,000 and then there's all
14 this criticism about it can't possibly be 80,000. It's
15 80 --

16 ACTING DIRECTOR WILLIAMS: It's 43.

17 SECRETARY BLUMENFELD: -- you're right, 43.

18 ACTING DIRECTOR WILLIAMS: It's 43,000.

19 SECRETARY BLUMENFELD: But then there's some
20 others that say it's like 24,000 and then 7. But my --
21 even if it was 2,000 is my point, that's a lot. Like
22 80,000 is like -- even 43; I mean, it's beyond anyone's
23 comprehension. No one in their daily lives can
24 comprehend that many chemicals that are out there. And
25 so the pace of producing chemicals obviously outstrips

1 our ability to analyze them and understand how to shape
2 that policy.

3 So I mean I think the evolution is really to
4 fulfill your promise, which I think you're doing. But
5 there's just a lot more appetite for more and faster, so
6 that's what I kind of got of it. So, that isn't -- and
7 explaining that science often doesn't go quickly
8 sometimes it frustrates people. And that's sometimes why
9 they want to jump ahead of it. "Like why do we have to
10 wait for the science? Let's just get it," whatever "it"
11 is, "done." So explaining that it takes time to do
12 rigorous peer review science and it takes time to analyze
13 it and the benefits of doing that are that at the end
14 it's incontrovertible or at least it's a lot more
15 supportable.

16 So I think those are the kind of dynamic
17 tensions that you are going to have to navigate and think
18 about.

19 Yeah, one of the first things we did in San
20 Francisco is write the opening to our municipal code as a
21 precautionary principle. And thinking about how we ask
22 questions differently, so rather than asking how much
23 risk is allowable ask whether that product is actually
24 necessary. And whether alternatives exist, really, is at
25 the heart of what you are doing. But reframing some of

1 the questions around risk assessment and management and
2 thinking about how that could apply in context further
3 afield than consumer products, I think is something that
4 I'd be interested in talking with you about.

5 PANEL CO-CHAIR FONG: So besides doing more and
6 doing it faster, do you see this program as a possible
7 driver for economic development that the original Green
8 Chemistry Initiative was thinking?

9 SECRETARY BLUMENFELD: Absolutely. I mean, I
10 think the reason that California's GDP is way ahead of
11 the rest of the nation's when you look at a state-by-
12 state basis is because of their innovation and the desire
13 to not rest on our laurels where we are now. And these
14 kind of forward-thinking whether it's a low-carbon fuel
15 standard or thinking about how we build transit-oriented
16 development communities or thinking about environmental
17 justice and how we deal with trade and goods movement,
18 all those are opportunities for economic development.
19 And we see that they are.

20 So in every business you're going to have
21 status-quo products and businesses that aren't able to
22 catch up. And then in the case, one early example in
23 California was the catalytic converter. You know, the
24 people that sold catalytic converters, that business did
25 well. The company that sold internal-combustion engine

1 with no controls, they didn't do so well.

2 So, often if we only look at one part of the
3 picture the folks that are making methyl ethyl death,
4 they may not do so well. But they may understand and see
5 the writing on the wall from what you're doing and say,
6 "It's time for us to change and transform," which you see
7 in a lot of large fossil-fuel companies are now switching
8 to renewables, switching to energy efficiency.

9 So I think what you're doing is sending strong-
10 market signals about the direction of the California
11 economy. And with 40 million consumers and obviously
12 manufacturers that don't want to make things just for the
13 California market, you around this table have an outsized
14 influence to be in a position of helping push innovators,
15 push more businesses that have a product that now has a
16 niche because of you. So absolutely this is a big
17 economic tradeoff, maybe not quite as big as Apple, but
18 one day.

19 PANEL CO-CHAIR FONG: Well, we're not going
20 anywhere, so.

21 SECRETARY BLUMENFELD: Excellent. I know,
22 because you've got like a round building you can't go
23 anywhere. That's why it's called the infinity loop,
24 right?

25 PANEL CO-CHAIR FONG: That's the old campus.

1 The new camp is Apple Park.

2 SECRETARY BLUMENFELD: Okay. It's been bred
3 into you. I like that. You work with Lisa?

4 PANEL CO-CHAIR FONG: Ah yes, it's a pleasure
5 in working with Lisa.

6 SECRETARY BLUMENFELD: Yeah, she's cool. Lisa
7 Jackson was my boss at EPA and now is a boss at Apple.
8 Cool.

9 PANEL CO-CHAIR FONG: Thank you.

10 ACTING DIRECTOR WILLIAMS: Thank you.

11 SECRETARY BLUMENFELD: Now we go to the kids.
12 (Laughter.)

13 ACTING DIRECTOR WILLIAMS: I just got to see of them.
14 Thanks Jared.

15 SECRETARY BLUMENFELD: Thank you.

16 PANEL CO-CHAIR FONG: Thank you and the kids.

17 So at this point let's continue with our
18 meeting, so let me just go over the agenda for this
19 morning. So we'll begin today with a public comment
20 period. After which we'll spend actually much of the
21 morning discussing the programs review of submitted
22 Alternatives Analysis. Xiaoying Zhou from the program
23 will give us an overview of the program's efforts to
24 prepare to receive and review the AAs this summer.

25 And then Dr. Whittaker from ToxServices will

1 then give us a presentation about her experience
2 reviewing AAs and advice that she thinks would be helpful
3 for DTSC.

4 We'll follow these presentations with, again,
5 quite a bit of time this morning for a panel discussion.
6 And if time allows, we'll just come back to some of the
7 topics that we touched on yesterday that you think should
8 require additional thought and discussion.

9 So, at this point public comments.

10 MS. RASMUSSEN: Before today's panel discussion
11 we will once again be taking public comments. If there
12 are webinar participants who wish to comment at today's
13 meeting please email your comments to
14 SaferConsumerProducts@dtsc.ca.gov and it will be read
15 aloud. Comments submitted remotely will be read to the
16 panel after we hear comments from those in the room.

17 The public is reminded that today's comments
18 are directed to the Green Ribbon Science Panel and on
19 agenda topics; that is, the materials that were presented
20 by the panel. Public comments directed to DTSC are not
21 appropriate at this meeting.

22 Please note it that the panel is not able to
23 respond to comments or answer any questions as this is a
24 working meeting. If you have not signed up to comment
25 you may do so at this time. Staff have commenter cards

1 for you to indicate that you wish to comment. Based on
2 the number of comments we may need to limit the time.

3 So we have one so far from those in the room.
4 Does anyone else have one here in the room? Okay.

5 Now we have Kraig Kurucz from Lockheed Martin
6 Space coming up to give a comment.

7 MR. KURUCZ: Good morning members of the panel
8 and DTSC staff. I'm Kraig Kurucz. I'm from Lockheed
9 Martin Space and I'm coming to make a comment just to
10 explain a situation. We have a specific use for
11 methylene chloride strippers. And we are hopeful that
12 someone will request that there be an AA done on this
13 topic. But since it would require the vendors, and we
14 buy five gallons a year, we're not really sure if they
15 will come in and do that.

16 Our particular use is always done wearing a
17 specific PPE for methylene chloride and in a paint booth
18 that has excellent ventilation and is downdraft and is
19 approximately the size of this room. So we really
20 delimit the exposure. We do support removing it from
21 regular consumer activities, because of the problems of
22 people that don't have that kind of equipment or
23 supervision, so we certainly understand that.

24 Like I said we use somewhere between two and
25 ten gallons a year always on rework, either something

1 brought back to us from the field if it's something that
2 maybe the military customer was using. Or as part of a
3 satellite where something failed tests. We do a lot of
4 testing before launch, because we can't go out there and
5 repair things. So if a bond is suspicious or some
6 coating, anti-reflective coating or something like that
7 is maybe going to flake off later, they will remove that
8 and make a repair.

9 These coatings are very efficient. They're
10 thixotropic, so they're like a gel and they stay on. I
11 checked on the last use. They worked on nine satellite
12 parts that they had to recoat, and they used 20 mls,
13 because they do stay right there. So we don't have to
14 splash it on or anything like that.

15 We do use alternatives when it's available. It
16 just depends on the type of hardware. So some of our
17 hardware is made out of what they call honeycomb core, so
18 it's expanded aluminum and it looks like honeycomb. And
19 all we have to bond it to a carbon sheet on the top and
20 carbon sheet on the bottom, or maybe titanium, would be
21 just those knife edges. So there's not a lot there, so
22 the adhesives need to work really well. And then we test
23 it and see if it pulls apart and so forth and if it does
24 then we have to redo that work.

25 The key thing about honeycomb core is because

1 it's going to into space, we can't have even a drop of
2 water in that core. In space it would just expand and
3 blow up that part. So it's very critical. We only use
4 this on the kind of parts where we can't use water or we
5 can't use corrosives, because the alternatives tend to be
6 either acidic or basic in their action and how they work
7 to remove paint. And we also have really small runs, so
8 we don't have any kind of production line.

9 I just brought a couple of examples. I'll pass
10 these around. These are just some products we recently
11 made, so that one landed on Mars. And we made one, and
12 so it needed to work. Obviously, it will be a few years
13 until we can send a mechanic there. (Laughter.)

14 That concludes my remarks. Thank you.

15 MS. RASMUSSEN: Thank you very much.

16 MR. KURUCZ: Mm-hmm. Thank you.

17 MS. RASMUSSEN: Any other comments from those
18 in the room? Okay. I'm not seeing any.

19 We have one that came in yesterday afternoon
20 after our commenting period had ended, so I will read it
21 today. Unfortunately, the person that they wrote it
22 towards is not here with us today, but I'm hoping she's
23 joining us via Webcast. So this question was from Megan
24 Schwarzman.

25 "Have you considered the CPDat Database at EPA?

1 It contains recent product ingredient and composition
2 data from active SDSs and other sources at Walmart, PG&E,
3 Drugstore.com, etcetera. Not California-specific, but it
4 would ID categories to focus on by chemical." This was
5 sent by Brian Penttila with the Washington Department of
6 Ecology.

7 I do not believe we have any more public
8 comments at this time. Seeing that we do not have any I
9 will close our public comment period. And I will turn
10 the meeting back over to our Co-Chairs.

11 PANEL CO-CHAIR FONG: Thank you very much
12 Kerry.

13 At this point we'll now hear from Xiaoying
14 about the Department's Alternatives Analysis review
15 process.

16 MS. ZHOU: Thank you, Art, and good morning
17 everyone.

18 So this is outlined for my talk today. First
19 up, a quick recap of the SCP AA process. I will go over
20 the recap and numbers of the AA reports we expect to
21 receive and review this year. And then we'll talk about
22 some changes we anticipate for our upcoming review and
23 our ongoing efforts to address those changes, which
24 include the environment of the internal review process
25 and our capacity building activities. Then I will bring

1 up some questions for the panel's discussion.

2 So this is a simple flow chart of the SCP AA
3 process. These color blocks represent the three parties
4 involved in this process. The orange's steps represent
5 compliance actions conducted by manufacturers of the
6 priority products. It is typically a two-stage AA
7 process. The first stage of AA is a screening analysis,
8 which generates the preliminary AA reports. And the
9 second stage AA is an in-depth analysis, which generates
10 the final AA reports. And the manufacturers also have
11 other compliance options. And then the blue color
12 represents the Department's review. And we also have the
13 green for the public engagement. There is a 45 public
14 comment period after the summation of the final and
15 abridged AA report.

16 So as you can see, the 180 days after the
17 priority product is listed in the regulations the
18 preliminary AA report is due. Then the Department has
19 typically 60 days to review them and to issue the Notice
20 of Determination.

21 So when will those AA reports come in? And
22 what are types of the AA reports and how many of each?

23 As Karl yesterday mentioned, for the paint
24 stripper with methylene chloride the preliminary AA
25 reports are due July 1st and so far we've got 10 priority

1 products notifications and covered 49 unique products.
2 And one of the manufacturers has already submitted the
3 product removal confirmation, so which leaves us
4 different scenarios for the remaining 48 products. That
5 would be removal/replacement notifications, preliminary
6 AA reports or abridged AA reports.

7 And there are going to be some scenarios for
8 how manufacturers choose to combine them. They could
9 combine them based on the brand or composition or product
10 tab or specific application. Or some may be conducted by
11 consortium, but at maximum we will get 48 different AA
12 reports for this product.

13 And for the SPF systems with the MDI, the
14 preliminary AA reports are due August 26. And this
15 Friday is going to be the due date for PPNs. And as of
16 the yesterday we have the 3 priority products
17 notifications already been submitted, which cover the 33
18 unique products. And we expect there is going to be a
19 change by this week, end of this week.

20 So what will the Department review those
21 reports for? The regs list of the general requirements
22 and specific contents requirements for different types of
23 the AA reports, and also the Department of Review
24 Criteria. But they are pretty general, but the reliable
25 information is specifically defined in the regs. And

1 those have been provided at the supporting documents in
2 your meeting. (Off mic colloquy re: slides.)

3 And for the preliminary AA reports once we've
4 received them then the AA review process starts. And we
5 have the 60 days to review them and issue the Notice of
6 Determination. That could be the Notice of Compliance,
7 Notice of Deficiency, Notice of Disapproval or it's a
8 Notice of Ongoing Review. If a Notice of Deficiency is
9 issued the responsible entities have 60 days to address
10 those deficiencies and resubmit their revised AA report.
11 And then the Department has 30 days to review to review
12 that revised AA report and issue the final determination.

13 And this is -- it looks a lot more complex,
14 because for the abridged AA report the review scheme is
15 quite similar as a final AA report. If one functional,
16 acceptable and technically feasible alternative is not
17 available manufacturers may submit abridged AA reports,
18 which skips some steps of the two-stage AA process and
19 speed up their R&D activities. And so the abridged AA
20 report has the same due date as the preliminary AA
21 reports, but the review scheme is the same as final AA
22 reports.

23 And after the abridged AA report is received,
24 so first of the 45-day public comment period starts.
25 Then the Department has 30 days to review those comments

1 and assigns a due date to the RE to address those
2 comments. And after the RE submits the AA report
3 addendum then the typically 60-day review cycle starts
4 again.

5 And there's also another pathway in lieu of the
6 AA process that is a Removal/Replacement Notification.
7 And there is some flexibilities built into this process,
8 given the different situations of the manufacturers. But
9 I'm not going to cover the more details, because of focus
10 of today's review is the AA reports.

11 Next, I'm going to talk about the challenges
12 for our review. There's the three main challenges or the
13 constraints: time, resources and decision making.

14 So, the number one challenge is time. We have
15 a short turnaround time for the reviews, typically it's
16 60 days. And as I just mentioned there are some
17 uncertainties involved with when those AAs comes in and
18 how many of them. And so our effort is to address those
19 challenges and try to be helping folks to make our
20 internal review process as smooth as possible. And we
21 have developed an internal AA review process document,
22 which details the internal procedural elements and the
23 work priorities, so everyone on the team will understand
24 their roles and responsibilities. And instead of the
25 traditionally linear project or management approach,

1 agile process will be applied to expedite the process.
2 And because this is -- for those who are not familiar
3 with the agile process it is a particular project
4 management tool method open-use dating the field of the
5 software development. And because this is, for those who
6 are not familiar with the agile process, it is a
7 particular project management (indiscernible) often used
8 in the field of software development. And because this
9 is the first time for all of us to review the actual AA
10 reports this agile process can help to break down that
11 60-day review cycle into smaller sprints and daily
12 briefing meetings. So the staff can have an almost real-
13 time communication with management about some
14 unpredictable situations and potential issues and help to
15 make a quicker decision to resolve those issues.

16 And we also have other tracking tools to help
17 us to track those that work, progress and to manage our
18 workload more efficiently to meet that short timeframe.

19 In addition, we also continuously work on the
20 testing of the CalSAFER backend, because that's going to
21 be the platform for us to assign the tasks to staff and
22 transfer the documents and communicate our decisions with
23 responsible entities.

24 And finally we also worked with our CalSAFER
25 team and IT folks and the operation (indiscernible) unit

1 and legal. And to make sure that the environment and the
2 process is safe to handle the trade secret information
3 during the AA review process.

4 So the next challenge I'm going to talk about
5 is the resources. Due to the very unique and
6 comprehensive scope of the SCP AA framework it requires
7 unconventional skillsets of the staff to review the AA
8 reports. And again, this is our first time. And we
9 certainly have a small and new team. And while we have
10 to fill some expertise gap, the first thing we will do is
11 to leverage our existing resources and expertise within
12 the program and within the Department, so our efforts to
13 date and including the new hirings and the recruitment
14 and internal and external technical training and
15 coordination.

16 And we're also conducting our own technical
17 research and reviewed the literature libraries for
18 specific chemical product combinations to educate
19 ourselves about those technical issues we might be seeing
20 in the coming AA reports.

21 And we also did some mockup AA reports review
22 to get more experience.

23 And the next one is about decision making. So
24 as we know the AA itself is not a decision-making tool.
25 It cannot point to a value-based decision for us. So

1 it's a process to collect and analyze the information to
2 support and inform the decision. So our review is not
3 just only about technical validation. There is going to
4 be a lot of the value-based decision making involved in
5 that process. And there are going to be those case-by-
6 case determinations.

7 And also, we expect different scenarios and
8 qualities will be seen for those upcoming AA reports. So
9 our efforts are including continuously proactive
10 stakeholder outreach and engagement activities, so we try
11 to provide clarification and assistance for the
12 compliance and to build up that trust. And our team has
13 also devised a completeness and technical review
14 checklist to document our decision rationales for
15 consistency and transparency.

16 And we also have a sub-team who is working on
17 researching those different impacts of the potential
18 regulatory responses, given different scenarios. And to
19 set up a link between the AA with us and the regulatory
20 response. So this whole access, this whole process is
21 now just a paper exercise. That is really action-
22 oriented.

23 So those are the specific questions that are
24 also included in your meeting materials for the panel's
25 discussion, so we really are looking forward to hear the

1 tips and experience from Meg and the input from all of
2 you. Thank you.

3 PANEL CO-CHAIR FONG: Thank you very much.

4 So at this point I'm going to ask the panel
5 members if they have clarifying questions for Xiaoying.
6 And again, we have -- we're setting aside over an hour
7 and a half or more deep-dive discussions, so if you can
8 limit your questions at this point to just clarifying
9 questions. I see Mike has his sign up. Mike, Elaine,
10 Mike?

11 PANEL MEMBER CARINGELLO: Okay. Thank you for
12 the presentation. Well done. When you talk about the
13 response times, when you have the timelines, are the
14 response times that you lay out are those by regulation
15 or are those by what DTSC is estimating the timing to be?

16 MS. ZHOU: That's by regulation

17 PANEL MEMBER CARINGELLO: Okay. That's what I
18 was thinking. And are the number of revisions that an RE
19 can make is that also limited by regulation?

20 MS. ZHOU: Yes.

21 PANEL MEMBER CARINGELLO: Okay. And it just
22 seems to me that between the response times and the
23 number of revisions it's going to be difficult -- and it
24 goes to your first question -- it's going to be difficult
25 to balance how you have a robust discussion. And really

1 meet up with RE and say, "Okay. Here's what we're really
2 looking for." And give them time to give you a good
3 response, versus having a fast program, so you can get
4 more throughput.

5 MS. ZHOU: Yeah, that's true.

6 PANEL MEMBER CARINGELLO: Thank you.

7 MS. ZHOU: Thank you.

8 PANEL CO-CHAIR FONG: Thanks Mike.

9 Elaine?

10 PANEL MEMBER COHEN-HUBAL: So this is a very
11 quick one, there was the slide with the blue box of
12 comments? I just didn't get to read it.

13 MS. ZHOU: The first one?

14 PANEL MEMBER COHEN-HUBAL: The box in the --
15 can I just --

16 ACTING DEP. DIRECTOR PALMER: Reliable
17 information?

18 ACTING DIRECTOR WILLIAMS: Yeah.

19 PANEL MEMBER COHEN-HUBAL: What was it?

20 ACTING DEP. DIRECTOR PALMER: The reliable
21 information box?

22 PANEL MEMBER COHEN-HUBAL: Yeah. Do you mind
23 just putting that up while people are asking their
24 questions? I just didn't read it. Thank you.

25 MS. ZHOU: Yes. Sorry, this is the one that's

1 kind of screwed.

2 PANEL MEMBER COHEN-HUBAL: Okay. Can you just
3 leave it for a minute?

4 ACTING DIRECTOR WILLIAMS: And again, that's
5 straight out of the regulations.

6 MS. ZHOU: Yeah.

7 PANEL MEMBER COHEN-HUBAL: Okay. So do we have
8 that? We don't have that part in here?

9 MS. ZHOU: You probably don't have that. It's
10 in the definition section for the reliable information.

11 PANEL MEMBER COHEN-HUBAL: Thank you.

12 PANEL CO-CHAIR FONG: Okay. I have Kelly next.

13 PANEL CO-CHAIR MORAN: Yeah, thank you,
14 Xiaoying. This is really helpful. And although our job
15 is really to talk to you about science, I appreciate that
16 you shared with us some of the management approaches that
17 you're using so we can see how the team work and
18 preparation fits in with our discussion today. And where
19 you're headed, which is super-exciting. It feels like
20 you're just doing so much groundwork to be ready for
21 this.

22 I wanted to make sure I understood the
23 timeframes of when the AAs would arrive. And just to
24 make sure I correctly grasped the workload and what we're
25 advising on in this first round. So the AAs are due, the

1 first set are due on July 1, but they could come before
2 July 1, right?

3 MS. ZHOU: Yes. They can come any time before
4 July 1, so some may come very close to the due date, but
5 some may come earlier.

6 PANEL CO-CHAIR MORAN: Yeah. Most people seem
7 to want to do things on the due date, but some people are
8 like me and come a week or two early, because we're
9 nervous about doing it wrong. I'm the one who files
10 taxes early. You know, how I am. So, but you still
11 only --you don't have 60 days from July 1 you have 60
12 days from when they file?

13 MS. ZHOU: Yes.

14 PANEL CO-CHAIR MORAN: Okay.

15 MS. ZHOU: When they file.

16 PANEL CO-CHAIR MORAN: So there will be --

17 MS. ZHOU: When we receive that.

18 PANEL CO-CHAIR MORAN: Okay. So there will be
19 some ruling in the review and that you'll have to respond
20 to some of them before you've completed the reviews on
21 others.

22 MS. ZHOU: Mm-hmm.

23 PANEL CO-CHAIR MORAN: And the 60 days includes
24 the time for preparing your written response and internal
25 review of that?

1 MS. ZHOU: Yes. All of them.

2 PANEL CO-CHAIR MORAN: Yes. That is, for those
3 who don't work in government that's a very big deal, so
4 that's having dealt with 60-day review periods myself.

5 And then the review criteria, I think they were
6 underneath the thing that Elaine was just looking at,
7 they're pretty broad right?

8 MS. ZHOU: Yeah.

9 PANEL CO-CHAIR MORAN: Yeah. So and that's all
10 the reg says about it, right?

11 MS. ZHOU: Yeah, review criteria down.

12 PANEL CO-CHAIR MORAN: So you're really looking
13 for completeness and accuracy?

14 MS. ZHOU: Yeah.

15 PANEL CO-CHAIR MORAN: So scientific quality.

16 MS. ZHOU: Yeah.

17 PANEL CO-CHAIR MORAN: So that's typical.

18 MS. ZHOU: For the reliable information it's
19 about the quality.

20 PANEL CO-CHAIR MORAN: Yeah. So the criteria
21 here are pretty typical to the types of things that we
22 assigned as we'll be doing our peer reviewing something,
23 we'd be really thinking through that. But perhaps a
24 little more depth on the quality of the data underlying
25 the assessments, so oftentimes when we we're peer

1 reviewing an article we don't have access to that part.

2 MS. ZHOU: Mm-hmm.

3 PANEL CO-CHAIR MORAN: Okay. That helps a
4 bunch. Thank you.

5 MS. ZHOU: Thank you.

6 ACTING DEP. DIRECTOR PALMER: Can I just add a
7 quick point of clarification?

8 PANEL CO-CHAIR MORAN: Yes.

9 ACTING DEP. DIRECTOR PALMER: Is that our
10 regulations do allow responsible entities to collaborate
11 and coordinate on their AAs. And so for both of these
12 priority products there are trade associations that have
13 indicated they are going to be doing some of that. We're
14 not sure to what degree, so the numbers that Xiaoying
15 presented are that are sort of worst-case scenario in
16 terms of numbers. But we might get elements of an AA
17 that are collectively done or we might get an AA, one AA
18 that represents five responsible entities. Again, we
19 don't know yet to what degree they'll take advantage of
20 that.

21 And it's potentially complicated, because
22 they're competitors and they are trying to figure that
23 out. But we are coordinating with them directly, so
24 we'll get a little more insight to that as time goes on.

25 PANEL CO-CHAIR MORAN: So do you think you're

1 going to get one AA per manufacturer or one AA per
2 product or -- because I saw on methylene chloride, I
3 think it was 10 manufacturers and 48 products? So what
4 would your expectation be for the maximum, 10 or 48 some
5 number in between?

6 ACTING DEP. DIRECTOR PALMER: Well, the
7 theoretical maximum is that we could get one per product.
8 But I think realistically, because a lot of them are
9 similar there's going to be sort of a nesting of the
10 materials that may be packed. So there's going to be a
11 lot of overlap, I suspect, with any termed responsible
12 entity and perhaps across responsibility. We're not
13 really sure.

14 ACTING DIRECTOR WILLIAMS: And I would just say
15 that I think the specificity of the product definition in
16 terms of the application is going to determine whether or
17 not there's a difference in the products. In other
18 words, we've had so many conversations about what's the
19 intended use of the product. And if that's what's used
20 to define the product then I would expect it to have an
21 unique AA based on that functional requirement.

22 ACTING DEP. DIRECTOR PALMER: So more than 10
23 if you're in the 48.

24 PANEL CO-CHAIR MORAN: Okay. Thanks.

25 PANEL CO-CHAIR FONG: Thank you, Kelly.

1 Jack?

2 PANEL MEMBER LENARD: You referred to the
3 internal AA review process document. I don't have --
4 have we seen a copy of that? Because that would be of
5 interest for, at least, for me to review and see what
6 things you may want to add or what things you may have
7 forgotten about or didn't realize that people do in
8 conducting AAs.

9 MS. ZHOU: I don't know, Tony?.

10 MR. LUAN: Oh yeah, we do have an internal
11 document. But it's mostly to assign roles and
12 responsibilities. It's not something that we've prepared
13 for external consumption, but we could clean it up and
14 send it out. But I don't think it would very be useful.

15 PANEL MEMBER LENARD: Oh, just because you
16 referred to it I just wasn't sure what that was. Was it
17 just strictly the process or did it go into more detail
18 as to who does what and what types of things do you look
19 at?

20 MR. LUAN: Not what types of things you look
21 at, but who does what.

22 PANEL MEMBER LENARD: Okay.

23 MR. LUAN: So it assigns main responsibilities,
24 the timeframes and other people.

25 PANEL MEMBER LENARD: Okay.

1 PANEL CO-CHAIR FONG: Are there any more
2 clarifying questions? If not, Xiaoying, thank you very
3 much.

4 MS. ZHOU: Thank you.

5 PANEL CO-CHAIR FONG: Now we're going to switch
6 gears and hear from Dr. Whittaker of ToxServices on her
7 extensive experience reviewing AAs and her
8 recommendations for AA reviews. Meg?

9 DR. WHITTAKER: Great. Thank you.

10 Well, reviewing AAs has made me very humble.
11 And you'll learn to be humble too throughout the process.
12 Then you do have quite a challenge, so I've been very
13 lucky in that I haven't had to look at dozens of AAs at
14 once with people from many, many disciplines. The types
15 of AAs I've looked at have really -- I do have a degree
16 in economics, which is kind of funny that not many people
17 know about, but it's been very economic-light. And the
18 focus has always been on hazard and performance, but
19 you've got the full Monty. So I'm going to just give you
20 some recommendations. What I tell you today are just my
21 recommendations from the school of hard knocks. And it's
22 been very hard knocking.

23 And whenever I try and train someone in how to
24 either be a risk assessor or an alternatives assessor or
25 a chemical hazards assessor, I would say, "First of all

1 you've got to know what your goals are and what questions
2 are you trying to answer." And obviously you know your
3 guide, because you wrote it. And it's a very good guide.
4 I think the manufacturers out there who take the time to
5 read it and dig into Chapter 11 will hopefully give you a
6 good work product for you to work with and make your
7 decisions on.

8 And you do have a lot of challenges, because as
9 you go into different priority products and identify
10 different chemicals, the tools and techniques and methods
11 that companies are going to use to identify safer
12 alternatives, if they do that as opposed to one of the
13 other alternate approaches, they're going to have a
14 different game plan. So you're not going to write a
15 beautiful SOP that will identify every single step to
16 follow every single time. So don't get frustrated. I
17 learned a long time ago not to be frustrated.

18 And the goal, remember what the responsible
19 parties are supposed to be doing for you is to give you
20 reliable, valid and plausible Alternatives Assessment, so
21 that by the time someone knocks on your door they should
22 have already thought of all those things. And you may
23 want to consider more and more workshops and over-
24 communicate that, they should give you something that's
25 ready to go. They should understand that those are the

1 goals. And you've given them a great checklist. So I
2 wish this would have existed a few years ago, because it
3 would have made my life a lot easier and I would have had
4 less gray hair.

5 My first tip is that you have to understand the
6 product type. Also, to save face with a client I've
7 learned, when I started looking at boat paints, I knew a
8 little bit about paints from working on Cradle to Cradle
9 assignments. But I learned right away that if you don't
10 even know the vernacular of what they're speaking they're
11 not going to open up and tell you the story of their
12 product and first of all, why they were using a Chemical
13 of Concern.

14 We heard this morning from Lockheed Martin why
15 methylene chloride is being used. And most people that I
16 know are not intentionally using a hazardous and risky
17 chemical without reason. So understand, read everything
18 you can. Order the Kirk-Othmer. Even though it's
19 getting older it's still a wonderful place to start to
20 understand the basics of the product type and data mine
21 that. Data mine Google Books -- sorry, Art had to say
22 Google. But get to know it. You need to understand it.
23 Even if you're a toxicologist or an economist you need to
24 know the background of that product type. It will make
25 it so much easier. Learn from me.

1 And I always say to my staff, "You've got to
2 understand the 5Ws and 1H as to why is that Chemical of
3 Concern being used in the product? How is it used? Why
4 is it used? Where is it used? Where is it used in the
5 process? Is it a contaminant? That will make it so much
6 easier. And I look at that and I think, "I wish someone
7 would have told me that." So if you know that it will be
8 a lot easier.

9 And it will be more fun too. I think for
10 those, we're all inquisitive or we probably wouldn't be
11 here, I look at it like a challenge to try and
12 understand. And also to figure out whether the proposed
13 alternatives really make sense. Because some people
14 propose alternatives I see, and there's no way that the
15 alternative would fly. And so that will help you, too,
16 to see which proposed alternatives just won't work.

17 Don't try and assess something you're not
18 trained to do or if you're doing that work with someone
19 more senior. Junk in equals junk out. And you're going
20 to get better as time goes by. When I look at my first
21 GreenScreen, it scares me, from 2008. And you know, we
22 keep it as a joke to remember -- or my first risk
23 assessment too -- you're going to get better over time,
24 so I don't think anyone is expecting you to hit a home
25 run right away. I think in a year or two you guys are

1 going to be the best in the business.

2 But don't set yourself up for failure. You
3 need to understand, for those of you that are assigned to
4 certain parts, if you don't even understand the
5 difference between reproductive and developmental
6 toxicology, learn now. Buy that Casarett and Doull's and
7 dive into it. And ask questions, don't be shy. Don't be
8 embarrassed. Get on those workgroup calls and say, "I
9 have no idea."

10 I work with a really good toxicologist named
11 Nancy Linde who came on board a few months ago. And what
12 I love about her is that she's so humble. She'll say, "I
13 have no idea." And you know what? She probably does
14 know, but it makes it so much easier. So you need to
15 know every aspect. If you don't anything about exposure
16 assessment pull every single article you can pull, make
17 it open access. I do it on the cheap, I go to PubMed and
18 I read everything out there that my competitors have
19 done, so that I can understand something new. And I
20 email them, I pick up the phone and call them. If
21 they're going to write about, they should know what
22 they're talking about.

23 And remember, you need to identify reliable, as
24 we've already heard that term -- Klimisch is our friend -
25 - and appropriate test methods, hazard frameworks and

1 exposure models.

2 And remember, the people who are submitting to
3 you are supposed to be experts in their product type.
4 But they're not necessarily an expert at LCA, there are
5 very few people who are experts at LCA that I've ever
6 met, or Economics, or Chemical Hazard Assessment. Get
7 full copies of those test reports. If they're doing
8 emissions testing and it's only on one day and it's a
9 volatile chemical, well not on volatile chemicals; that's
10 probably not a good test. Those generally will go up and
11 up and up and maybe they'll go down. But how do you know
12 you're looking at the right emissions testing? Get that
13 full report, see what those laboratories are testing.

14 Most laboratories we work with are very
15 friendly. And I can imagine that they would give you a
16 free Webinar or educate you in their methods. The ones
17 we work with are very proud scientists and yeah, because
18 they have their proprietary test methods, so they're
19 probably not going to want to give you their protocols.
20 But they'll be happy to talk to you about, "Well, what's
21 the basics of emissions testing." And "What's a Tedlar
22 bag? You know that's not really an emissions test? It
23 does collect volatiles, but that's different than an
24 emissions chamber.

25 So ask lots of questions and take great notes.

1 My laboratory notebook, my super-secret, top-secret one -
2 - I had to say it a couple of times -- is stuck in my
3 office. And I keep a Xerox duplicate in case there's a
4 fire or an earthquake or something. But you're going to
5 need to take a lot of notes and then share with each
6 other.

7 Cited publications are interesting, because you
8 really need to see what they're talking about. So I'm
9 not too sure on what the power you have to say, "Well, we
10 want to see full copies of every cited publication," but
11 that's kind of important for you to really dig into it.
12 So if you have the authority to do that it might be a
13 good thing. So you're going to get buried in paperwork
14 relatively quickly, but at least you'll be able to dig in
15 and see what's the basis. I have just oodles of
16 publications in my office.

17 And then it's important for you to take a look
18 at who's performing these AAs that you are going to be
19 reviewing. Are these people qualified to perform an AA?
20 If they've never, if they're not a risk assessor or a
21 chemicals hazards assessor or they've never worked in a
22 laboratory are they really qualified to do it? It
23 doesn't necessarily mean that that AA is going to be sunk
24 from the get-go, but take a look at who they are. That's
25 really important, because you're going to see a whole

1 gamut of quality, I'm guessing.

2 It's important for the hazard frameworks, and
3 test protocols, and test methods that are used to
4 classify hazards be really reliable and they be robust.
5 All of you who are toxicologists are familiar with OECD
6 Test Guidelines. The Klimisch scores that are used to
7 rate reliability are based on, are from BASF, but were
8 done to assess OECD Test Guideline studies. They are
9 there for the reading. And they're not light reading,
10 but you need to get to know them. You need to download
11 the Klimisch article from RTP and get to know that as
12 well.

13 I would recommend, if you're looking at
14 exposure modeling, those AAs ideally should completely
15 document all exposure equations and calculations. I'm
16 always very suspicious when I see, for example, a Safe
17 Harbor Report, and they've come up with let's say an NRSL
18 and there's no basis for it. Or they quantify the
19 exposure to a Prop 65-listed chemical, for example, and
20 they won't disclose the equation that was used to
21 calculate the exposure. Whether it's inhalation or
22 indirect oral, you should be able to see everything.
23 That should be part of the process. And in Chapter 11 of
24 your Guidance you've made it very clear you want to see
25 it all. So that's quite key.

1 The test methods and the frameworks, as I've
2 said, that are used should be reliable. And it's really
3 important that those undergo external validation. We
4 want to make sure that they're reliable. We want to make
5 sure that they're scientifically based. And that they're
6 appropriate to answer the question at hand. And there's
7 a really nice OECD Guideline -- the hyperlink works
8 though -- 34, that talks all about this. Because what's
9 going to happen is it's not just GreenScreen anymore,
10 there are lots of other chemical hazard assessment and
11 tools, SciveraLENS.

12 Well, you need to ask yourself has that
13 undergone external evaluation. Has someone smarter than
14 all of us in this room looked at that and said, "This is
15 a great way to assess hazards. If not just make sure you
16 double-check and look under the hood. Or else you may
17 find that, you know, something saying, "Sure. This is a
18 safer alternative," has completely overlooked an
19 important hazard endpoint. So I just warn you on that,
20 because I've seen that really mess up some clients.

21 You're going to have to have this dynamic,
22 ongoing training. It's like a marathon, you're never
23 going to stop running. I'm constantly, maybe relearning
24 over and over and over how to be a better alternatives
25 assessor. I highly recommend that I try and do it on the

1 cheap, I'm a cheap marathon runner, that you're going to
2 have to juggle your work and you've got a timeline. But
3 I'd recommend that you get involved.

4 I really have enjoyed the recent discussions of
5 the BizNGO Hazard Group. We've been talking about
6 endocrine disruption, which is front and center right now
7 all over the world. And they get presenters from all
8 over world giving their two cents. And we share
9 publications and discussions, so you just have email
10 Shari Franjevic to participate. And there's no cost.

11 And I'd highly recommend you become
12 GreenScreeners. Even if you're not a toxicologist we
13 contribute our staff for free as instructors, because
14 that was done to us. We were trained by someone more
15 senior. And the registration deadline for the different
16 courses are coming up, so consider joining us. It's not
17 scary and we're friendly. I'm friends with people all
18 over the world now because of it.

19 You heard about the NAM workshop that you can
20 also participate in remotely that I mentioned yesterday.
21 And then of course our community and as an alternatives
22 assessor you're only as strong as A4, so we're always
23 looking for members. And we know that we need to keep it
24 interesting and grow the profession. And believe me,
25 you're going to want to have someone to fill your shoes

1 in a few years when you guys are awesome alternatives
2 assessors. And just think, if we have A4 growing someone
3 will coming knocking on your door and you won't have to
4 go through this entire learning process. It'll be a
5 little bit easier, so I encourage you to join A4, it's
6 really inexpensive.

7 So these are some of my tips. It's always
8 going to different; it's never going to be the same thing
9 with any AA. And I'm always happy to share my little
10 bits of knowledge with anybody if you'd like to contact
11 me. But those are some of my tricks and tips. Thank
12 you.

13 PANEL CO-CHAIR FONG: Meg, thank you very much
14 for a very informative presentation, and those excellent
15 recommendations. And I especially appreciate you taking
16 time out of your very busy schedule and flying out from
17 D.C. to join us for the last two days.

18 At this point let me see if panel members have
19 any clarifying questions.

20 DR. WHITTAKER: Oh, and I just had one more
21 slide I wanted to show. So this is kind of interesting
22 and it relates to reliability. About 40 percent of the
23 toxicity studies in the America in the '70s were
24 performed by Industrial Bio-Test Laboratories. And I
25 know that the older toxicologists here who I'm speaking

1 to know the whole story of IBT. But the fraud and animal
2 abuse and plagiarism at IBT created the whole Good
3 Laboratory Practices movement. And still, because there
4 were thousands of studies you are going to find IBT
5 studies cited in AAs to substantiate safer chemical
6 selection.

7 And it's interesting. I just saw another one
8 pop up in a risk assessment that was trying -- they were
9 using their chronic study as the basis. And not all IBT
10 studies are suspect. The non-acute ones are the ones
11 that are considered unreliable, so it would Klimisch 3,
12 right? And so just keep an eye for that, because this
13 will pop up -- it was amazing -- over and over.

14 And I find it -- it's kind of a fun story to --
15 I mean, it's sad, but it's a fun story to tell to
16 scientists as to, "Well, how did Good Laboratory
17 Practices come about?" And if you google IBT you'll read
18 about the whole story.

19 But this is wording that we use. And the
20 important part about this is that it cites to a great
21 OECD guidance document from 2005, which was quite some
22 time ago, but it's still a great document. It's the
23 "Manual for the Investigation of HPV Chemicals: Data
24 Evaluation." Take a whole afternoon and probably a whole
25 box of cookies and dig into that. But it will talk to

1 you and lead you through, really, how to look at data and
2 how to look at suspect data. Because not all IBT data is
3 unreliable or are unreliable, but a good part are.

4 So I thought about this last night, because I
5 was corresponding with a client overseas who had this
6 issue with the study. But just remember that. I think
7 this is another really good trick to teach you or tip.
8 And download that reference. And the OECD website has
9 other good citations too, so thanks.

10 PANEL CO-CHAIR FONG: Thank you.

11 MS. ZHOU: Will all the slides be posted?

12 UNIDENTIFIED SPEAKER: Yes.

13 MS. ZHOU: Okay, thank you.

14 PANEL CO-CHAIR FONG: Let me just go around,
15 unless I received their clarifying questions for Meg.
16 Ms. Williams?

17 ACTING DIRECTOR WILLIAMS: I'm cheating, I
18 don't know that this is a clarifying question or
19 something for discussion, but I was interested in kind of
20 your workflow process, how iterative your review process
21 is. Do you do a first overall scan of what you have and
22 just give it a kind of high-medium-low quality? And I
23 don't know -- that's not entirely a clarifying question,
24 but I do want to get it out there quickly.

25 PANEL CO-CHAIR FONG: No, that's okay.

1 DR. WHITTAKER: We reverse engineer it. So we
2 have our own checklist, kind of like you do in Chapter
3 11. And especially if you're going to be looking at 20
4 at the same time, another issue you're going to have is
5 trying to keep, make sure you treat each of those
6 equally. So I reverse engineer it and I'll look at how
7 well -- I'd print out your checklist. If I were you, if
8 I'm working for Meredith, I would get my checklist. Or I
9 would make it into a checklist, because you're probably
10 going to want -- you may want to, I don't know, we have
11 QC at most processes where decisions are made. And
12 triage it and see which ones go to the top of the pile
13 and which ones go to the bottom of the pile. And the
14 tougher ones will go to the more senior staff, it's sad
15 to say, because those will need more CPR.

16 And so we reverse engineer it. And figure out
17 right away do they even need the sniff test for
18 evaluation, because some don't. Hopefully none of yours
19 will.

20 PANEL CO-CHAIR FONG: Thank you. Ken?

21 PANEL MEMBER ZARKER: A question, I appreciate
22 your presentation. One thought I had is, because DTSC is
23 a public agency and this, just the normal email dialogue
24 that will go all along among the staff as they evaluate
25 these, are all subject to open records. And so do you

1 see any potential issues there that you maybe don't
2 experience in the private sector that you would think
3 about if you were in our shoes, in their shoes doing this
4 work?

5 DR. WHITTAKER: Yeah, that's a good point.
6 Yeah, you'll have to learn to be PC. Yeah, that's a --
7 you have to -- you have another layer of yes. And
8 obviously everyone should be treated with respect. And I
9 don't think industry would use it against you if it's a
10 junior staff member and they're not familiar with the
11 Henry's law of constant and they don't understand
12 something. But yes, you'll have to make sure your staff
13 are aware.

14 And because email, we use email as you're not
15 going to run to everyone's office, and we use email a lot
16 to communicate when we split apart different parts of an
17 AA. So yes, that's very true. So you're going to have
18 to learn PCA all the time, because it is discoverable,
19 you're right. Good point.

20 PANEL CO-CHAIR FONG: Thank you, Ken.

21 Are there any more clarifying --Kelly?

22 PANEL CO-CHAIR MORAN: Actually, I didn't stick
23 my card up, I broke the rule.

24 Meg is your approach and workload different
25 when you review a risk assessment as compared to an AA

1 and if so, how?

2 DR. WHITTAKER: Yes, because a risk assessment
3 will be very focused on one end point and generally one
4 person. If we're reviewing -- so we create our own risk
5 assessments, but we also peer review or help clients who
6 decide they want to perform their own risk assessments.
7 That will generally just go to one staffer who then will
8 look at it, write it up and it gets QCed before it goes
9 out.

10 So this is different, because you have so many
11 other people. You've got an entire team involved. And
12 it's unusual for us. We'll have maybe at the most two
13 people work on a risk assessment. Maybe someone will do
14 benchmark dose modeling if it's super-complex. And
15 another toxicologist will write up or evaluate the
16 studies.

17 This is a different kettle of fish, because
18 you're going to have to parse out different parts of the
19 evaluation depending on which stage of the AA. I think
20 the second stage will be a little easier, in my opinion.

21 PANEL CO-CHAIR MORAN: So when you're talking
22 about risk assessment, you're talking about one with a
23 single end point, so not the kind where you're assessing
24 the risk against other chemical against all the end
25 points. So (indiscernible)

1 DR. WHITTAKER: Right. Yeah.

2 PANEL CO-CHAIR MORAN: Okay, so that's a whole
3 different thing then.

4 DR. WHITTAKER: Most people out there are
5 performing regulatory risk assessments just to address
6 one health effect end point and assess whether it's an
7 NRSL or an MADL as opposed to "We're going to assess
8 risks against an entire slew of hazard end points and
9 figure out the likelihood of harm."

10 PANEL CO-CHAIR MORAN: Yeah, that's the kind I
11 review all the time. So that's why I'm asking that
12 clarifying question, because it's completely different
13 than what you described.

14 DR. WHITTAKER: Yeah, so what would you do? So
15 you -- well I'll just --

16 PANEL CO-CHAIR MORAN: I'll address that when
17 we get to the staff review. Because I actually have a
18 lot of experience doing 60-day reviews for government
19 agencies, so let's wait till discussion, okay?

20 DR. WHITTAKER: Okay.

21 PANEL CO-CHAIR FONG: Let me ask one last
22 question right now. Meg, how often do you have to pull
23 in external experts to cover something that you might not
24 have, in-house expertise?

25 DR. WHITTAKER: Less than 20 percent of the

1 time. It also gets to be very expensive. And yeah.

2 PANEL MEMBER BLAKE: Can I follow up on that?

3 DR. WHITTAKER: Mm-hmm.

4 PANEL MEMBER BLAKE: Where do you need that
5 external expertise? Where is it needed?

6 DR. WHITTAKER: Usually LCA. The economics
7 that have been done thus far on most AAs are pretty, I
8 don't want to say easy, but they're very -- they're more
9 qualitative than quantitative. And the performance
10 testing is easy to understand. It's the LCA part that is
11 challenging.

12 PANEL MEMBER BLAKE: Thank you.

13 PANEL CO-CHAIR FONG: Are there any more
14 clarifying questions? If not Meg, again, thank you so
15 much.

16 DR. WHITTAKER: Oh, thank you for having me.

17 PANEL CO-CHAIR FONG: At this point let me turn
18 the mic over to my Co-Chair to start the in-depth
19 conversation on AA reviews.

20 PANEL CO-CHAIR MORAN: Can I make some comments
21 first?

22 PANEL CO-CHAIR FONG: Yes, please.

23 PANEL CO-CHAIR MORAN: But that's not a good
24 Chair role, so do you mind sharing for a couple more
25 minutes?

1 PANEL CO-CHAIR FONG: Absolutely.

2 PANEL CO-CHAIR MORAN: Okay. I wanted to put
3 out here I do a lot of review of pesticide risk
4 assessments. So there they're looking at one chemical
5 and all of its various uses and end points across the
6 whole array of human and environmental health. And I
7 have been doing this since 1999. Most of what I review
8 are EPA risk assessments, but I also review -- and
9 there's a lot of stuff published in the literature as
10 well. And so although I'm focused on aquatic I've also
11 had likely for a dozen years, anyway I've reviewed the
12 human health ones on a lot of them.

13 And a couple of parallels here: a really
14 important parallel, a super resource limited, I'm working
15 for government agencies and have access to agency staff
16 to help with the peer review. So it's all agency-funded,
17 but nowhere near as the depth of experience and the
18 skills that DTSC has thank goodness for that. So there
19 will be things that I know you're going to be able to do,
20 and much broader than my experience.

21 The pesticide risk assessment process,
22 particularly from EPAs, they've started batching things.
23 So at first they were coming out one at a time, so I had
24 time to really dig in and go through all this stuff and
25 access the experts and so forth, per just one risk

1 assessment. Now they're batching them at 20 or 30 at a
2 time and they have the same 60-day review period. So I
3 was -- when the regs were proposed and the science panel
4 advised on that, I was one of the strong advisers against
5 tying to the 60-day review period, because of having
6 extensive experience with that.

7 And part of the problem as I alluded to earlier
8 is that you need to do all the science work, but still
9 leave enough time for that science/management
10 communication in making the decisions. For the
11 organizations that I work for there's typically a three-
12 to-four-week review process between the draft set of
13 comments and the ability to submit them, which leaves an
14 extremely short period of time for the science work to
15 occur. Especially when you're working on multiple ones
16 at once.

17 So I have great appreciation for the challenges
18 ahead of the staff here and the compression of that time.

19 So I do have a few thoughts from my experience.
20 The first one is kind of what Meg said, that you can do a
21 once-over on a risk assessment and pretty quickly see the
22 overall quality of it. And it's over and over and over
23 again. I've reviewed so many of them now it's easier
24 after you've reviewed a bunch. But you all have reviewed
25 a whole bunch of AAs, so when you were assessing them for

1 California work, so I think you have more experience than
2 you think you do. So I just want to let you have a
3 little more confidence that way. Great.

4 As the more you review the more you can see,
5 right away, the quality and where that risk assessment --
6 or in this case, the AA, is headed.

7 The biggest focus of my review at this point
8 has been on what's missing. So that's the reason that
9 it's so great that you all have so many PhDs on the
10 staff. Because one of the things the scientists learn,
11 as we proceed through professional training, is first
12 we're examining the information, looking at the
13 methodologies, those kinds of things; looking as facts.
14 As you study for your PhD the big thing that I learned in
15 my PhD is to find the holes. What's wrong? What's
16 missing? The really big picture kind of stuff. And so
17 I'm super-psyched that you have so many PhDs and folks
18 who have that level of experience on the team. Because
19 the biggest thing in reviewing them isn't what's there,
20 it's what's not there. And so that's super-huge.

21 In this case I think keeping your eye on the
22 ball is really important, what really matters. So there
23 are lots of things that are wrong in the documents that I
24 review, but only some of them matter. And so you're not
25 going to be able to review every underlying document for

1 everything that's there. And just coming to accept that
2 is hard, it's really scary to say, "Oh, I'm just going to
3 not be able to do everything." And one thing I do is
4 where I can, benchmark with other sources. So you have a
5 tremendous opportunity to benchmark if there's enough
6 overlap in the review times on the AAs, to benchmark them
7 against each other.

8 And the second thing is to really focus on that
9 the ball here is the AA work plan. So keep your eye on
10 the ball. The ball in the first phase AA is getting the
11 right AA work plan for the second phase. So does it have
12 the right alternatives? So I'm always looking at the
13 pesticide risk assessment, at do they have the correct
14 description of all the uses and the pathways and so
15 forth? And you're going to be asking the same question,
16 "Are all the uses covered? And "Are all the exposure
17 pathways out there and covered? And which ones are
18 important?" That's how you're going to get to the
19 figuring out what the relevant factors are. You want to
20 make sure the right relevant factors are carried over
21 into the second phasing AA, so that's the ball.

22 So those are some ways that I use to organize
23 my review; do the once-over, try to figure out what's the
24 quality here, what are the most important things from the
25 perspective of the purpose of my reviews that we were

1 doing up for the state. So that's the AA work plan. And
2 what's missing? So do we have the right relevant
3 factors? Are we missing things? Are we missing exposure
4 pathways? Are we missing other kinds of stuff?

5 So I'll come back later, perhaps, with some
6 more detailed comments, because I know you all have some
7 questions. But I kind of want to really lay that out
8 there.

9 I suspect some of the other panelists have
10 probably also done some reviews. A lot of times that
11 might be helpful, so part of my wanting to go first was
12 to hope that some other folks might give us some of their
13 approaches and workloads. Thanks.

14 PANEL CO-CHAIR FONG: Kelly, thank you very
15 much.

16 Jack?

17 PANEL MEMBER LINARD: Put that down. I want to
18 reiterate some of Meg's comments. I'm not a
19 toxicologist, I don't review the safety, but I have done
20 a lot of alternatives assessments by looking at plausible
21 substitutions. Just a couple of things Meg said really
22 hit home with me.

23 And I don't see, I've read the methylene
24 chloride document. I've also, the last time we were
25 together, there was an NPE document. Both of those

1 actually don't even discuss why the chemical is being
2 used.

3 Each one has unique chemistry. NPE I'm much
4 more familiar with, it has some very unique chemistry and
5 that is why it is being used, has been used in the
6 industry. It's chemistry that's been known for decades,
7 which is why, when companies try to mimic that chemistry,
8 they knew exactly what they had to do in order to achieve
9 the right level of hydrophobicity, you name it. And they
10 have done it. I mean, so I just want to point out you
11 really need -- the first thing you need to do is say,
12 "Why is this chemical being used for this application?"

13 In the case of methylene chloride I started my
14 career in paint and coatings yet the paint and coatings
15 are not a homogeneous field. The substrate is not
16 homogeneous. What may work on a latex paint on wood, may
17 not work at all on a thermoset on steel. So I think as
18 you begin to review these you've got to understand the
19 alternatives that are being proposed may not even work
20 well on the particular application. So I think you need
21 to look at that. Are we going to confine it to just
22 normal household products and most always latex paints?
23 Some are not. Thermoset paints on plastic, you're going
24 to have a very different type of alternative. That could
25 be totally viable, but it may be very specific to that

1 particular coating and that particular substrate.

2 Methylene chloride I imagine, and again I'm not
3 the expert on it, may have just a perfect blend of
4 polarity. The fact that it's not in a water-soluble
5 product means you're not going to swell wood. It won't
6 sit on it. And that's one of the problems with water on
7 wood, is it swells it. And then when you're trying to
8 strip the paint off the wood is now not as structurally
9 sound as it was if you just use methylene chloride.

10 So I just -- you need to do all your homework,
11 which is what Meg said. Do all your homework. Why is
12 that chemical being used? And I think you'll get ahead
13 of the game, so that when these come in you'll be much
14 better prepared to do as Kelly said, more quickly assess
15 the comprehensiveness of that relative to what you
16 thought going in.

17 So I think that's -- and just I'm glad Meg
18 mentioned Klimisch scores. Industry pays a lot of
19 attention to the Klimisch score, which tests the
20 robustness of any clinical safety study. Now I'm not the
21 expert, but I do know when my toxicologists see a report
22 out there I ask them, "What's the Klimisch score?" Older
23 tests generally get lower scores, because they weren't
24 done to the same robustness that the newer tests were
25 done to. So Klimisch scores of 3 eh, 5 is good. So look

1 at that.

2 So I'll leave it at that for the moment. I may
3 come back in other comments.

4 PANEL CO-CHAIR FONG: Okay, thanks Jack. Thank
5 you very much.

6 Let me see if there are other panel members
7 that have initial reactions or preliminary thoughts about
8 the AA review presentations and recommendations for the
9 staff?

10 So Xiaoying?

11 MS. ZHOU: Maybe just one follow-up question on
12 Jack's comments.

13 And I think when we do our own technical
14 research we found out that actually the functional
15 acceptance is really kind of the hard part. Although we
16 have the chemist, the engineer, but really to understand
17 the product itself it's really difficult. Especially for
18 like methylene chloride, it seems like there's no
19 industry-testing methods. And so do we just trust the
20 companies that say, "Now make this work," or they just
21 show like ones maybe using extreme time-consuming
22 alternatives if one does not really meet their
23 requirements.

24 So how can we -- so what is a good supporting
25 information to support their claim?

1 PANEL MEMBER LINARD: I think the one thing for
2 paint and coatings there is a trade association, which
3 does a lot of education on different types of coatings,
4 the National Paint and Coatings Association. There are
5 educational materials.

6 In that, again it's not methylene chloride,
7 it's what you're actually trying to strip off. There's
8 going to be a lot of information about chemistry. And
9 the science of that via powder coating or latex or
10 standard old-fashioned linseed oil-type coating, the
11 alkyd-type paint, so each one has different properties.
12 And those are the things that you're going to have to
13 worry about. Because methylene chloride, I think, just
14 gets lumped -- it works on everything, but the
15 alternatives may not.

16 And there may be a specific alternative for one
17 application, which absolutely just doesn't work for
18 another for various technical reasons, substrate and
19 coating.

20 PANEL CO-CHAIR FONG: Yes Mike?

21 PANEL MEMBER CARINGELLO: So I didn't feel this
22 was a clarifying question. And it can kind of go both to
23 Meg and to Kelly now. But I thought it was really
24 interesting in Meg's presentation how she said you need
25 to get to know the product, you need to get to know the

1 science, so that you understand what's being presented.
2 But we heard earlier that really what we're looking for
3 is reliable information. The DTSC is not here to
4 actually write the AAs. They're here to review that they
5 got reliable information and it met the needs.

6 How do you -- and as you were just saying DTSC
7 has a bunch of very good scientists, they've got a lot of
8 PhDs. These people know what they're doing. How do you
9 step back from being the scientist, being an AA author,
10 and how do you step back and take only 60 days and just
11 hit that right piece? How do you not use the science and
12 all that information that you've gathered ahead of time
13 while you're waiting for them to write it?

14 It just struck me as that it's a balance, that
15 maybe they could be advised on how that's done before
16 they start to get these AAs in.

17 DR. WHITTAKER: Well, I know part of the
18 regulations say, "Well, what's submitted has to be
19 plausible." So for you to understand what's plausible,
20 at least I would need to know the basics. And I tend to
21 go overboard, which I don't recommend anyone to do if you
22 want to have a normal life. But yeah there's a balance
23 like Kelly said. But you have to kind of dig in and
24 understand, you have to feel the pain of the manufacturer
25 who is having to change the way that they were doing

1 things. And it makes it a lot easier to understand where
2 they're coming from, at least for me, if I understand the
3 basics of the product type and the chemical.

4 So I try and find review articles, book
5 chapters, I data mine Google Books. I look at patents
6 and come up with a story, so I'll write down and I try
7 and reverse engineer. And because I'm on the billable
8 hour people want it faster and cheaper. So if I can do
9 it you guys can do it, believe me. So I just reverse
10 engineer it, look at patents, Google Books and then
11 figure out how is this being used. And then by the time
12 you start getting those submissions you won't most likely
13 be overwhelmed with, "Wow. What is this product?" and
14 "Why are they doing this?" Hopefully. I don't know,
15 does that make sense?

16 PANEL MEMBER CARINGELLO: Yeah.

17 PANEL CO-CHAIR MORAN: I kind of feel like the
18 staff have a real leg up on this, because they did the
19 product profile and they've spent a lot of time in
20 communication with the industry. So I'm suspecting the
21 kinds of things we're talking about here none of them are
22 news, right?

23 DR. WHITTAKER: Correct.

24 ACTING DEP. DIRECTOR PALMER: Can I just
25 comment on that?

1 PANEL CO-CHAIR MORAN: Yeah. Yeah.

2 ACTING DEP. DIRECTOR PALMER: I think your
3 point's good is that sometimes we don't give ourselves
4 enough credit. But I also like to view credit -- you
5 know, the industries that we're regulating here have been
6 very engaged from the get-go and have provided us a lot
7 of insights into their world and process. Some of them
8 are here today who have come out.

9 For example, one of the manufacturers of
10 methylene chloride products came out and showed how they
11 do their AA, the difference in performance and different
12 substrates and things like that. It was very
13 informative. The SPF community has given us a lot of
14 information and been engaged. So we have a fair amount
15 of understanding, but the devil is in the details. And I
16 think because the process is new that one of our concerns
17 about the engagement on the documents and that process as
18 opposed to the general knowledge, which has been pretty
19 good. So this is all very helpful.

20 PANEL CO-CHAIR MORAN: Yeah. I just feel like
21 in responding to Mike's question one of the key things is
22 for the AA, one of the key things is going to be the
23 selection of alternatives and the description thereof.
24 For my experience in viewing AAs, which is far more
25 limited than Meg's, the gap has been the range of

1 alternatives being adequate. And I think that was one of
2 the really huge -- yeah, one of the fundamental gaps.
3 But in the step that should come in the first phase has
4 been that range of alternatives, because California's
5 requirement for examination is so broad.

6 You know, pretty much every AA is going to need
7 have some sort of mechanical needs. To examine the
8 mechanical removal, an alternative in it, that's
9 completely unique in California as compared to other
10 places. So I'm expecting or at least for the methylene
11 chloride ones, so I'm expecting that questions about that
12 scope of alternatives are going to be really broad.

13 When I'm doing my initial review, I'm looking
14 for those kinds of key areas that indicate thoughtfulness
15 and sophistication. And really, truly examining
16 alternatives and not -- so in a pesticide risk assessment
17 I'm really looking at thoughtfulness and how the uses are
18 described in the data transport. Here it's probably
19 going to be a different set of things. I think one of
20 those is very likely to be the description of
21 alternatives, the identification and description of
22 alternatives. How detailed and thoughtful that is. Some
23 of the stuff we've been talking about here likely to play
24 in. I don't know for sure.

25 And the other one is the really how thoughtful

1 the end points selection is. So there again I see a lot
2 of missing stuff. One thing I forgot to mention earlier
3 is that a key thing for me is having the document I'm
4 reading not reflecting the knowledge of the scientific
5 literature.

6 So I'm suspecting that you all are already
7 thinking about what the alternatives are and collecting
8 some of the literature and being familiar with that in
9 that area. And what I find is some risk assessment
10 documents selectively omit stuff. And I'm never sure if
11 that's intentional or not. In some of the stuff that I
12 read oftentimes, particularly the government stuff, I'm
13 pretty sure it's not intentional. But and sometimes
14 those are really important. So that goes back to the,
15 "Is it important or not important?" for the overall
16 direction of where things are going to head for
17 management decision-making.

18 But it is remarkable how the same weaknesses
19 appear over and over again. And I know you've already
20 been through that process with staff in identifying some
21 of those themes, so I'm suspecting you'll be able to see
22 them again.

23 Does that answer those?

24 PANEL MEMBER CARINGELLO: Yeah, that helps.

25 Yeah.

1 DR. WHITTAKER: Yeah.

2 PANEL CO-CHAIR FONG: Elaine?

3 PANEL MEMBER COHEN-HUBAL: So, I'm not sure I
4 formulated my thoughts well. But I guess what I'm -- I
5 have not been involved in reviews, but I've peripherally
6 seen a lot of activity around how we're in the EPA
7 changing and improving the review process both in like
8 the IRIS program where IRIS, they're actually developing
9 the assessments. And then OPPT, the Office of Pesticide
10 and -- Pollution Prevention and Toxics, not Pesticides --
11 is really ramping up and revising their process.

12 So for a couple reasons, both to improve, make
13 things flow more quickly, but also to really make sure
14 that to facilitate both the speed in which the review can
15 be done. But the sort of the breadth and rigor of that
16 review and then the documentation, right? So both
17 programs spent a lot of time or are spending a lot of
18 time right now really automating some of the resources
19 that they use to help them with the review. And then the
20 documentation of that review, so having these processes
21 in place, which is something that I think you'll grow
22 into. But maybe if you get access to a couple of those
23 people, which I think you are, and learn more about what
24 resources they are in-house sort of developing and using,
25 this first round of reviews will be sort of an

1 opportunity to.

2 So you have your AA guide. You have the
3 reviews of the AAs that you did where you sort of dive
4 into, so for that AA guide what's it mean on each of
5 those checklists, right? So you have like more detailed
6 questions that you were asking to sort of evaluate. So
7 you do have these evaluations that you've done. But what
8 resources would it help you to have on hand to be able to
9 answer those questions besides just kind of eyeballing
10 things, right? Based on your sort of way, sort of your
11 own professional expertise, right?

12 So I think more and more agencies are going
13 towards really being able to build in literature review,
14 so if what you're wanting to do is look at the
15 alternatives. So they come in the -- and Kelly made this
16 point -- alternatives and the factors, did they get those
17 right? And that's kind of like I think, really, that is
18 really the important thing you're wanting to get at,
19 right?

20 So they're going to throw at you these
21 alternatives well how do you know that that information
22 is good, right? So right away you can go to the
23 chemistry dashboard and get one level of information on
24 those chemicals, right? And how do you sort of automate
25 that or build that process in that we are going to go?

1 And we want what's out there on the properties of the
2 chemical, what's out there on the tox of the chemical,
3 what's out there on the occurrence? You know, what's out
4 there.

5 The limitation of that dashboard is that a lot
6 of the information in that is based on -- and a
7 commenter, a public commenter talked about CPDat -- the
8 information in both of those systems is drawn from sort
9 of these big resources. The literature is captured in a
10 very limited way in those resources, right? So then
11 having a second resource where you can really automate
12 and have at your fingertips access to the broader
13 literature.

14 So people talk about systematic review, but
15 it's more than just systematic review in environmental
16 health now means one thing in terms of how you evaluate
17 the studies. But the bigger bang for the buck for review
18 and regulatory agencies is going to be really knowing
19 that you've done a good job seeing what's out there very
20 quickly getting down to, "Is there anything on this
21 chemical?" Because especially as alternatives, right,
22 they are just going to be data-poor? Because if they
23 were data-rich and everybody knew they worked they'd just
24 be using them.

25 So I think that's going to be like one of the

1 really big issues in evaluating any of these things is
2 that we're looking at data-poor. And there's GreenScreen
3 and other things, but they're still really data-poor.
4 And there's a lot coming out every day on things. And
5 the value of that information is different, because there
6 are new data streams. So how you use that information is
7 going to be kind of a learning thing and you'll sort of
8 build that in.

9 But it's not a small amount of work to get
10 these kinds of processes in place. But the value of it
11 is going to be both that you know you can be more
12 confident that you know, that you have information you
13 need. And the documentation process will become
14 automated. And you won't run into this problem where you
15 need to use half of your 60 days just to document, right,
16 because it will be happening as you go along. So I think
17 this first couple rounds is going to be this huge
18 opportunity if you use it. So like with what IRIS is
19 doing and Kris Thayer is doing you can learn a lot about
20 what you should sort of be looking for this round in
21 terms of building that out. And I don't see how you
22 cannot make that investment.

23 And it isn't going to be as burdensome as it
24 was a few years back. I think there's so many more
25 things to build off of. So the IRIS tools that they're

1 using you'd be able to sort of build off. And OPPT is a
2 lot more behind the firewall. That process is not as
3 open. But a lot of what they're using is just bringing
4 things like the Chemistry Dashboard tailored to their
5 workflow behind a firewall.

6 So all right. And I think that those were kind
7 of my main points.

8 PANEL CO-CHAIR FONG: Elaine, thank you.

9 Let's see, any additional comments? Well, let
10 me just in that case just touch on --

11 MR. LUAN: I'm sorry.

12 PANEL CO-CHAIR FONG: Oh?

13 MR. LUAN: I'm not sure if it's appropriate for
14 me --

15 PANEL CO-CHAIR FONG: Yeah, Tony. Please.

16 MR. LUAN: -- to say over here, but a lot of
17 these issues that are being brought up are very
18 encouraging for us, because we're trying to feel our way
19 through on how to review these AAs that are coming in,
20 methylene chloride especially.

21 But a lot of the topics that you guys mention
22 and the approaches that you guys mention are things that
23 we're sort of thinking about, so it's nice to have a
24 little bit of confirmation. You mentioned triage and we
25 were thinking about that as things coming in, as the AAs

1 come in, we will be looking at them holistically and we
2 will try to triage them very quickly. So I'm glad that
3 you're using that. And that's probably a good approach
4 for us to do that.

5 Mr. Caringello talked about the short
6 timeframes. And Anna Cross over here, one of our new
7 employees, she came up with the idea of having sort of a
8 concierge approach to the industry, the regulated
9 entities that we're working with. So we have assigned
10 staff to work with each of the responsible entities with
11 the AAs coming in. So we are maintaining contact, we are
12 trying to get an idea of what AAs area coming, and we're
13 trying to answer the regulatory questions. So we're
14 trying to get a jump ahead of the 60 days in terms of
15 working with industry and trying to get their
16 information.

17 We have an outreach program that's been put
18 together by Melissa, so we're trying to outreach to the
19 industry to see that we've covered everybody, that
20 everybody that should have filed has filed.

21 Alternatives, Kelly Grant of our staff has
22 contacted others. Greg Morose, a researcher, has done a
23 lot of research on methylene chloride alternatives and
24 we've been reviewing it and we've been trying to get
25 ahead of the alternatives. So we know that there are

1 alternatives and there are limitations. We're trying to
2 get educated on that.

3 We have GreenScreen training, that we've sent
4 most of our people to the introductory GreenScreen
5 training. I guess there's an intermediate training that
6 some of our people are going to be going to. And we're
7 trying to make a decision on the advanced GreenScreen
8 training, which seems to be very difficult. And we're
9 not quite sure whether that's appropriate or not. But
10 that's very encouraging to hear that that's something
11 that we should be doing and that's a good validation for
12 us.

13 You also mentioned the weakness on life cycle
14 analysis. And we're sending a couple of our staff, Anna
15 Gross, I'm sorry, Anna Gross and James Baker. They're
16 going to be taking Life Cycle training. So we're trying
17 to build up that expertise.

18 So I'm sorry, I just find this very encouraging
19 that even how we're feeling, to try to get our way
20 through this darkness, and to hear that some of the
21 approaches are somewhat things that other people have
22 used. So thank you for your input. I'm not sure if this
23 was appropriate, but I felt like it.

24 PANEL CO-CHAIR FONG: Absolutely, Tony. In
25 fact we encourage the staff to let us know when they have

1 specific questions that we can address.

2 PANEL CO-CHAIR MORAN: Can I say something
3 here?

4 PANEL CO-CHAIR FONG: Yeah, of course.

5 PANEL CO-CHAIR MORAN: Yeah. Helen Holder
6 wasn't able to be here today. And normally I wouldn't
7 talk to a committee member outside of the meeting, but I
8 scrupulously avoided talking to anyone else about this
9 topic, so that I could talk and get some comments from
10 Helen to relay. And I'm very much in sync with her on
11 this. Her main comment was, and recommendation to staff,
12 is the importance of benchmarking the AAs against each
13 other. That she's reviewed a lot of AAs and a lot of
14 other similar kinds of documents like I have, and
15 benchmarking is something that she's found to be really,
16 really valuable. And you all have that opportunity.

17 She has the same experience that I do. And
18 that opening up these kinds of documents and reading
19 them, pretty quickly you can tell if there's an agenda or
20 bias in them. And so some documents you open up and by
21 the time you're a third of the way through or sometimes
22 in the first couple of paragraphs you can see that it's a
23 difference of a particular thing or it's really aiming
24 towards one particular conclusion right from the very
25 beginning. And other ones are much more -- they may have

1 the same conclusion, but it's a really different approach
2 in the writing.

3 So and I asked her, "Can you give me examples
4 of the writing style?" And she said, "You'll just know
5 it, it'll leap off the page."

6 And she also points out that even with AAs,
7 with risk assessments -- we used to joke when I used to
8 work on risk assessments 20 some years ago and I was
9 doing EIRs, so that's why I looked at lots of
10 alternatives -- that you could pretty much make anything
11 have any level of risk with the right approach to the
12 risk assessment. She feels that, she cautions that even
13 in the AA structure it's still possible to make almost
14 anything look good. And that's not what you want.

15 And that's why benchmarking is so important is
16 that the agency really is trying to do a very independent
17 evaluation. And not go with one particular agenda, but
18 really think through the science and the alternatives.
19 And recognize that there are going to be differences
20 among all the products. But benchmarking is going to be
21 very helpful. So she just kept saying, "Say
22 benchmarking, benchmarking, benchmarking," so I'm saying
23 that. Thank you.

24 PANEL CO-CHAIR FONG: Yeah, actually, that's
25 one thing that struck me and I'll touch on that also, is

1 that the AAs that you're going to be getting compared to
2 the ones that are publicly available. You know, you
3 mentioned Toxic Use Reduction Institute, TURI, and some
4 of the ones that were done through the EPA partnerships.
5 Those, when it comes to alternatives, we're looking at
6 the entire range of possible, viable alternatives.
7 Whereas the AAs that you're going to be getting may be
8 promoting a specific alternative that they are trying to
9 push, so that's just something to keep in mind.

10 Let me go to Mike and then we'll break.

11 PANEL MEMBER CARINGELLO: And I'll be quick.

12 PANEL CO-CHAIR FONG: No, take a minute.

13 PANEL MEMBER CARINGELLO: And so I just wanted
14 to make a comment on the benchmarking concept. And I
15 want to go back to what Jack had said before with the
16 NPEs, and I'm going back to my days when I was a chemist
17 and developing surfactants, is be careful when you're
18 benchmarking that you don't say, "This company in their
19 AA said these things would work as a potential
20 replacement for methylene chloride or any other
21 chemical," and just assume that the other companies
22 should have considered that as well. Because depending
23 on the variations in their formula those items might not
24 be viable. It could functionally not work. So I think
25 you do have to take that step back.

1 And I'm not saying this is what Kelly or Helen
2 was implying, but when you benchmark you need to
3 benchmark as, "Okay, they found things. Could this have
4 been applicable?" but don't hold them to saying, "This
5 company found this as the best alternative. Why weren't
6 you even considering it?" Maybe it's a discussion to
7 have, but don't benchmark them and expect them all to
8 have all of the same alternatives available.

9 PANEL CO-CHAIR FONG: Mike, thank you very
10 much.

11 So let's take a 15-minute break. And come back
12 and Kelly will start the next discussion.

13 PANEL CO-CHAIR MORAN: Thank you.

14 (Off the record at 10:16 a.m.)

15 (On the record at 10:33 a.m.)

16 PANEL CO-CHAIR MORAN: We ready? All right,
17 I'm calling back to the order the meeting of the Green
18 Ribbon Science Panel. And thank you all very much for
19 only extending the break by three minutes this time. So
20 that's a good record actually.

21 So the remainder of the time we have here we
22 can talk more about the AA process. And we ask the staff
23 if they wanted to give us some follow-up questions in
24 addition to these, so we may have a little more
25 discussion here since we've got that time opportunity.

1 And we can also, if we like, cycle back around
2 to any of the previous comments. One thing we might want
3 to check in is some of the metrics stuff again. Art
4 asked a really good question this morning about economic
5 benefits of this program to the state. It would be fun
6 to have a little chat about that for a minute.

7 But right now it seems like it would be good to
8 come back to the charge questions here. And see if folks
9 want to pull the thread on any of these? So we talked a
10 little bit about methodologies, approaches or strategies
11 that the panel recommends. Is there anybody who wants to
12 say anything else about that for the sort of rapid
13 review? Or the critical pieces of the AA? I think we've
14 spent a lot of time talking about those two things.

15 Ann, you haven't said anything. And usually
16 you have a lot to say on these things, so I just wanted
17 to check in.

18 PANEL MEMBER BLAKE: I think I'm going to be
19 reiterating a lot of the points this morning, so I was
20 sort of holding back and wondering if that's a useful
21 thing or not.

22 PANEL CO-CHAIR MORAN: You always have
23 something useful to say, so I really don't want you to
24 hold back.

25 PANEL MEMBER BLAKE: Okay. Did you want to

1 finish your introductions before I do that?

2 PANEL CO-CHAIR MORAN: No. Those are the two
3 where we've really talked about, but we haven't -- we've
4 touched on Number 3 a little bit. But what are the key
5 elements, I guess we sort of talked about these things
6 all a bit. So I guess I'm looking to see if there's more
7 we can dive in on there. And if you want to say stuff
8 right now I think that would be very good. And then
9 maybe we check around with the rest of the panel about if
10 there's more you want to dive in on.

11 PANEL MEMBER BLAKE: I'm sure. I'll try and be
12 quick. I really appreciated Meg's presentation, because
13 I was sitting here thinking, "How on earth would I
14 classify how I do what I do?" So I thought I'd do a
15 little bit of context to see, so you can take it or leave
16 as how it's relevant to my approaches and how it's
17 relevant to what you're facing. Because what you're
18 facing is unique. But I did want to reiterate that you
19 do have more experience than you think you do. And trust
20 yourself on that.

21 And so I do a lot of, for different kinds of
22 clients, for NGO coalitions, companies and many others I
23 identify locations of hazards for particular products,
24 sentinel products or product categories. And then
25 summarize the pluses and minuses of available

1 alternatives. Or sometimes if I have that scope to say
2 what we would look for in a better alternative if it
3 isn't already on the market.

4 And then I also have some other small clients
5 that bring safer alternatives to the market. And I help
6 them articulate what their attributes are. So I think
7 the parallel that I see with your AA reviews is what's
8 relevant? And how do you articulate what's relevant
9 about a safer alternative?

10 And I would reiterate a lot of what was said
11 this morning about you already have a leg up on this,
12 understanding the process. Understanding the specificity
13 as Jack alluded to, if you're looking at specific
14 application, if you're looking, for example at a coating,
15 think about that particular application, what it's doing
16 on that specific substrate. You're probably going to
17 have that in the AAs that come to you for the methylene
18 chloride and its alternatives. So taking Mike's point
19 about benchmark, but don't hold that benchmark too
20 rigidly, because you're going to have different
21 applications. And so you have to have slight variability
22 in that benchmarking, because they're not going to be
23 directly comparable.

24 What else? I would reiterate also that you can
25 size up adequacy and inadequacy pretty readily, and

1 you'll get better at it. And also figuring out what's
2 relevant in each AA. Trying to think what else is useful
3 in this discussion.

4 I would second on the issue of triaging. I
5 mean, I would also say that I'm constantly being asked to
6 take on new product categories. And not necessarily
7 knowing what the relevant standards are in those new
8 categories. Residential building is the Wild West, I'm
9 just warning you, if you ever happen to take that on.

10 And believe it or not you have more -- that's
11 my personal experience of you have more expertise than
12 you think that's relevant to a new area. You know how to
13 pick out what's a relevant standard, "What do I need to
14 know about it? What are they testing? Is that
15 appropriate to this alternative that I'm looking at?"

16 Some of the challenges I've seen in safer
17 alternatives that take a different, sometimes non-
18 chemical approach, is that the existing standards don't
19 necessarily apply. So keep an eye out for that. It may
20 or may not come up with methylene chloride. It may come
21 up with SPF. So for example I'm thinking about anti-
22 bacterials. If you're looking at kill rates, but you
23 have an alternative that's a structural alternative that
24 doesn't allow bacteria to stick to a surface the kill
25 rate really isn't a relevant standard. So that's one

1 that's come up for me.

2 And anything -- so things to look for, I guess
3 an excuse that I have seen in an AA, a publicly available
4 AA from Europe, is don't fall for the excuse of the
5 alternative doesn't exist because we don't manufacture
6 it. That may seem like an obvious one, but the fact that
7 it has been submitted in a public forum is -- just saying
8 that may happen.

9 Yeah, I think that's about the main things that
10 I'm thinking of, that you are better prepared than you'll
11 realize. And you'll learn on the go and that's okay.
12 Nobody has tried to do this before. So not to scare you,
13 no pressure, but. And we're here to support you as that
14 goes on.

15 ACTING DEP. DIRECTOR PALMER: Ann, can I ask
16 you a question on your thoughts?

17 PANEL MEMBER BLAKE: Sure.

18 ACTING DEP. DIRECTOR PALMER: So I know you've
19 thought a lot about functional use and substitution and
20 so --

21 PANEL MEMBER BLAKE: It's like Kelly's brake
22 pad saying. I can't go a meeting without saying
23 "functional use."

24 ACTING DEP. DIRECTOR PALMER: But in the
25 context of this question of well, what is a viable

1 alternative? And if I'm a methylene chloride person then
2 am I going to be looking at sandpaper or something in
3 between? I'm curious if you have thoughts about how we
4 would approach dealing with that kind of process. What's
5 a reasonable approach to say where are you -- how you
6 evaluate those alternatives in which some may be clearly
7 outside the capability of someone to do, but still an
8 alternative. And then how within our construct a way to
9 --

10 PANEL MEMBER BLAKE: So let me rephrase your
11 question, so how do you evaluate a potential alternative,
12 alternative that's like a non-chemical alternative, for
13 example, to the same functional use?

14 ACTING DEP. DIRECTOR PALMER: Yeah, that would
15 be one example. Or I'm just -- and sort of lessons
16 learned in looking at people who are -- most people look
17 at their product. And this concept of first is there a
18 drop-in that we could do?

19 PANEL MEMBER BLAKE: Right, which doesn't
20 always exist. Yeah.

21 ACTING DEP. DIRECTOR PALMER: But there's a
22 range of alternatives. And particularly if there's a
23 range of functional needs and applications that there's
24 how do you kind of sort that from when you start saying,
25 "Well this is outside of reasonable and should it be

1 considered or not?" I'm just from a practical, not --

2 PANEL MEMBER BLAKE: A practical point of view?

3 I don't know. That's where I find the biggest

4 challenges, because it makes me, it makes us all rethink,

5 "Well, how are we achieving this particular function?"

6 ACTING DEP. DIRECTOR PALMER: Mm-hmm.

7 PANEL MEMBER BLAKE: I think probably what

8 you'll find is that they will fall into certain

9 categories of approaches to a particular question about

10 functional use. And then it'll become more relevant what

11 the relevant factors are for each of those alternatives.

12 I hope that that's helpful.

13 ACTING DEP. DIRECTOR PALMER: Yeah. Yeah, I

14 think it is.

15 PANEL MEMBER BLAKE: I think it's hard to talk

16 about in the abstract. It would be, yeah.

17 ACTING DEP. DIRECTOR PALMER: It is, yeah.

18 PANEL MEMBER BLAKE: Yeah.

19 ACTING DEP. DIRECTOR PALMER: Understood.

20 Thank you.

21 PANEL CO-CHAIR MORAN: All right. Other folks

22 who wanted -- Elaine could I just --

23 ACTING DIRECTOR WILLIAMS: Yeah. Oh, I'm

24 sorry.

25 PANEL CO-CHAIR MORAN: -- could I kind of

1 redirect that question to Meg a little bit? Because I
2 know you worked on the boat paint alternatives analysis.
3 And I know this is a big point of discussion. And I
4 wondered if you had any thoughts on that particular
5 question on functional use and the gaming of functional
6 use.

7 DR. WHITTAKER: Right. Well, I think you're
8 going to be receiving documents where they're advocating,
9 they've already made up their mind about probably the
10 alternative. And they're going to go through and
11 identify potential alternatives and the functional use.

12 I tend to look at, "Does it seem plausible
13 based on my little bits of scientific knowledge?"
14 Especially if they try and say, "Well, we can't use
15 these." Is it explained why? Does it seem
16 scientifically reasonable from that? And you've got
17 chemists on your staff and engineers. And they have more
18 expertise than you do right now.

19 So you'll be receiving a submission and you're
20 going to have to take some of what they say on face value
21 but dig into it. And that's what I do. I try and figure
22 out, pull the thread or I Google terms to see is this
23 really true? Not that you want to believe anything that
24 you Google, but -- don't Google your name -- but that's
25 kind of what we do to figure out for functional

1 alternatives.

2 And it's the same issue in looking at
3 performance testing when they're using in-house
4 laboratories I want to see pictures and especially if
5 there's no test method. Like you have USEPA Safer Choice
6 will allow for certain products to be tested in
7 performance testing if there's no real test method. But
8 believe me, if it's an in-house laboratory and it's a
9 company we've never heard of, and I've never audited the
10 company and their lab, I want to see pictures. I want
11 overkill on details before I believe it.

12 And not that everyone has to run to B.V. or
13 Intertek or any of the other ones. Lots of people have
14 good in-house labs. But ask, "Is it 17-025 accredited?"
15 If you don't know what that is Google that. Probably any
16 chemist does in here. But it's challenging because
17 people are going to try and spin a tale too, for certain
18 people. Not all submissions. I think like you said,
19 "Get that baseline, get that fast submission," and then
20 try and set the pace for everybody else, because you're
21 going to get some winners I know. And the other people
22 are going to have to submit to that level.

23 PANEL MEMBER BLAKE: Can I add to that, because
24 that example you brought up made me remember. But you'll
25 see you may get presented with alternatives that look

1 like a functional, a different answer to the functional
2 use, but it's actually just a tweak of the chemistry.
3 But it can be hidden in a different way. I'm thinking
4 boat paint particularly is minimizing the toxic Chemical
5 of Concern, but wrapping it in other stuff. It turned
6 out to be problematic.

7 PANEL CO-CHAIR MORAN: And I want to build on
8 what Meg said about study design. There are two kinds of
9 study designs. There's the kind that's really
10 scientifically done in a way that's going to provide
11 information about various alternatives or situations and
12 so forth. And there are other study designs that are
13 fundamentally flawed by some element of the design that
14 then lead to not providing the actual information. And I
15 don't think the DTSC is going to either have the time or
16 means to evaluate every study design in everything that
17 is submitted.

18 But particularly in areas like we were just
19 talking about, about the effectiveness testing, you can -
20 - examining the study design is going to be really
21 important based on the chemistry and all the other things
22 that are going on there. For anything that's going to be
23 absolutely critical in bringing in or leaving out a
24 relevant factor or bringing in or leaving out an
25 alternative.

1 So those kind of key -- there'll be a certain
2 number of studies. My guess is that it's just going to
3 be a few dozen. But at most, and maybe only a few, that
4 are going to be really important where you really want to
5 think about that.

6 There's a lot of gaming of study design.
7 Sometimes it's just complete lack of understanding and
8 particularly, I've seen this a lot in environmental fate
9 studies. So they use the wrong particle size, they use
10 the wrong fake rainstorm, they use the -- there's stuff
11 that's just so obvious if you come in from a different
12 field. But a lot of time folks who were designing those
13 just don't know. They've never done that kind of stuff
14 before and so you get these really weird or wrong
15 results.

16 That's something that is going to take some
17 thought in pulling apart. But it only really needs to be
18 done on those things that are critical on a yeah or nay?

19 PANEL MEMBER BLAKE: Yes. I would second that.
20 Are they asking the right questions in the study,
21 relevant questions?

22 PANEL CO-CHAIR MORAN: Yeah.

23 PANEL MEMBER ZARKER: So this is Ken. One of
24 the things I'm hopeful that folks are approaching this in
25 the spirit of the law as opposed to sometimes the letter

1 of the law. And I think that we'll probably get some
2 good or at least I'm hopeful that we're going to get some
3 good information.

4 My question is around sort of the issues that
5 come up around costs and availability for these
6 alternatives. And sometimes when you have something that
7 may hold a lot of promise, but it's a niche market and
8 it's not at the scale that may be needed to really
9 transform a particular product category. So I was
10 wondering if there might be some feedback on that,
11 thinking about that.

12 And then taking it to the next step, which is
13 maybe this regulatory response or regulatory action, how
14 that issue we're going to have to deal with plays into
15 some of the thinking in terms of when we talk about
16 innovation and advancing these kinds of things. So I've
17 been just thinking a little bit about that this morning
18 and how we -- and maybe the staff have thought about that
19 a little bit as well.

20 PANEL CO-CHAIR FONG: Go for it.

21 ACTING DIRECTOR WILLIAMS: So, yeah. I do
22 think that we're going to be in situations where
23 something's not ready for primetime. And this is where I
24 tend to look at Europe and look at REACH. And when they
25 do an analysis of alternatives and they set a timeline

1 for revisiting the analysis of alternative, if we were to
2 couple that kind of approach with the regulatory response
3 for Green Chemistry Funding then I think we're getting in
4 the neighborhood of practical solution to something that
5 has promise, but isn't fully proven, isn't known to be
6 scalable.

7 ACTING DEP. DIRECTOR PALMER: I might just add
8 that in going around talking to industry folks of
9 concern, I remind folks that we're not pre-determining an
10 outcome. So the course run of this process is doing the
11 AA and making something safer. And that might be
12 incremental. We might find the silver bullet that has
13 broad application. We might find certain applications
14 where there is a better alternative than not. It's
15 really going to depend on what comes in the door. And if
16 you just look at the regulatory responses those are just
17 one of the outcomes that we have.

18 The manufacturers have all kinds of outcomes
19 that they could suggest that would potentially move
20 innovation forward, making it safer. And I'll point to
21 this, our colleagues in the spray foam industry, when we
22 picked spray foam systems with MDI we recognized that
23 there really wasn't something off the shelf or even close
24 to dealing with those chemistries of those polymers for
25 making foam. But we also noted there are probably things

1 that could be done to protect the workers. And there are
2 probably advances that the industry could move towards,
3 but not a drop-in replacement to MDI that would be
4 equivalent. So it's important that we, this process
5 moves everything forward. And that could look like a lot
6 of different things.

7 PANEL MEMBER ZARKER: Okay.

8 PANEL CO-CHAIR MORAN: So you look like you're
9 about to say something. Go ahead, Jack.

10 PANEL MEMBER LINARD: I'm waiting for this
11 discussion to end, because I just had a couple of
12 comments. One, on Questions 3 and 4, 3 from a
13 manufacturer's point of view seems to imply an inherent
14 bias. I think you need to be very careful not to express
15 that, that you think everybody is trying to protect the
16 current market. So you may have that internally and
17 innately, but the bottom line is I don't think you should
18 express it. And to say you're just trying to hide
19 something or protect the status quo., I just think it
20 doesn't look good to say that, "Oh, you're just doing
21 this to protect what you've got." So I just think just
22 watch out for the words you use.

23 And Number 4, "What other types of things can
24 you do?" This is the Safer Consumer Products Regulation
25 and I'm sure there are products on the shelf, which are

1 not methylene chloride yet are paint strippers. Go to
2 Home Depot, go to Lowe's, go to your local hardware
3 store. See what's on shelf, because those products are
4 not going to be submitted for an AA, but they may still
5 exist.

6 So you can do your homework in advance. You
7 are a consumer as well. Take advantage of it and become
8 a consumer and see what else is out there. Because I
9 mean I said yesterday I do lot of shopping at stores I
10 normally wouldn't go into just to find out what's out
11 there? And that's a critical piece of being able to
12 understand the market is to say, "Yes there are methylene
13 chloride paint strippers. But there are other products
14 out there, which make similar promises." So I think it
15 just prepares you better for what you're going to get.

16 PANEL CO-CHAIR MORAN: Other comments from the
17 panel about any of these topics? I've got a couple
18 things I just forgot to say.

19 One of the clues for me that there's something
20 wrong with an AA is that it has conclusory statements
21 without sort of citations or thoughtful discussion. Karl
22 has been saying, "Show your work," since the beginning.
23 And I read tons of risk assessments where there are
24 conclusory statements. And I find them super-annoying.
25 But once again, I parse out what matters and what doesn't

1 and go with that. And some of those conclusory
2 statements are wrong, but they don't matter.

3 But that, to me, as soon as I start reading
4 things that -- you might see the conclusory statement in
5 the summary and then it's backed up by "show your work"
6 later on, but where you start seeing a lot of conclusory
7 statements that for me is a red flag. The person who
8 prepared that did not do a thoughtful job and wasn't
9 doing it.

10 And the other thing, sentinel exposures are
11 kind of something that I think are becoming part of the
12 scene here for necessity reasons, but they need to be
13 very carefully chosen. So I've actually seen many
14 examples where of one exposure is assumed to be sentinel
15 and the most important thing and is actually wrong. It
16 is a completely different thing that's going to be the
17 greatest exposure or going to cause the greatest harm.
18 So sometimes the greatest exposure doesn't go to the
19 endpoint where the greatest harm can occur. So a much
20 smaller exposure in a different media or location or
21 exposure pathway can wind up being much environmentally
22 relevant.

23 So that's a very chemical-specific kind of
24 thing. My great example of that is for the pyrethroid
25 insecticides, where most of them land on surfaces and

1 stay there. But it's only less than 1 percent of what's
2 used that actually matters. And the place it matters the
3 most is if it lands on impervious surfaces and gets
4 washed into creeks where tiny, tiny little concentrations
5 are harmful. So if you're looking at the sentinel you're
6 following it to the impervious surface and you might be
7 thinking about plant uptake or mammalian exposure or some
8 other kind of thing and you're totally missing the thing
9 that actually matters, which is that we're seeing
10 toxicity throughout aquatic ecosystems in urban areas in
11 California due to this.

12 So it's pulling the thread a little bit,
13 thinking through that concept of where is the sentinel
14 exposure the right thing? Where do we really need to
15 look more deeply at what is the exposure that matters?
16 And that's a combination of fate, transport and toxicity
17 data. And thinking all of that through is important.

18 I don't think that's going to be a huge thing
19 here for the first couple that you've got. And I don't
20 think there's a mystery in this. But it's just something
21 I want to call out, because I've seen a lot of people
22 using Don Mackay's kind of little box and say, "Oh it's
23 where it And then we'll look at it there." And it's
24 just -- and where most of it is what matters. And that
25 just doesn't work in, particularly, environmental

1 endpoints. So a couple other thoughts.

2 If there aren't comments on this, I guess I
3 wanted to turn to staff and see if you all had additional
4 questions.

5 Oh, I'm sorry, Ken's got one more.

6 PANEL MEMBER ZARKER: Oh, yeah. Thank you,
7 Kelly. I just wanted to follow up, a follow-up question.
8 You brought the issue of citations. And I wanted to get
9 some of your thinking around that, because there may be
10 some AAs that are more complex than others. And so I'm
11 wondering about the use of citations. Is it to make it
12 more defensible, to make it more -- You know, sometimes
13 I see citations in documents and some of them just go on
14 and on and on. And I'm starting to wonder like, well
15 what's the right balance here in terms of that level of
16 documentation? And so, trying to better understand your
17 thinking a little bit about around that, what's the right
18 balance for that?

19 PANEL CO-CHAIR MORAN: Well, that's a --

20 PANEL MEMBER ZARKER: And maybe others might
21 want to?

22 PANEL CO-CHAIR MORAN: Yeah. I'm thinking
23 Elaine and some other folks here might have some thoughts
24 on that. I mean it just generally when I'm reviewing
25 something as a scientist if somebody said something and

1 there's nothing to back it up, immediately I'm
2 suspicious. That's just the normal scientist peer
3 review.

4 But it's not necessarily the number of
5 citations it's the quality that really matters. And
6 again, it's the importance of that endpoint. In some
7 ways you want every sentence in the whole thing to be
8 cited. And of course that's not really where you're
9 headed. It's really every major concept having backup to
10 support the "showing your work." So I --

11 PANEL CO-CHAIR FONG: Can I just, Kelly?

12 PANEL CO-CHAIR MORAN: Yeah.

13 PANEL CO-CHAIR FONG: So how I use citations in
14 addition to the points that Kelly makes is actually it
15 helps me understand the author's thinking process.

16 PANEL CO-CHAIR MORAN: Xiaoying and then Ann.

17 MS. ZHOU: Yeah, Ann first and then me.

18 PANEL MEMBER BLAKE: I just want a point of
19 clarification. You were talking about sentinel
20 exposures?

21 PANEL CO-CHAIR MORAN: Uh-huh.

22 PANEL MEMBER BLAKE: And I know I mentioned the
23 word sentinel, so I just wanted to be clear that I was
24 using it in the context of sentinel products. That this
25 was a way for a retailer with a vast number of products

1 to figure out which were the ones -- and exposure was
2 part of it, but it was who is this product being marketed
3 to? Was there a vulnerable population involved? So it
4 wasn't quite the same concept. I just want to --
5 Xiaoying?

6 MS. ZHOU: Yeah. Just to follow up that
7 citation question. And for some alternatives we find out
8 there's a lot of, maybe not data-poor, but it's a data
9 breach. But there's conflicting information and they're
10 all published in those peer review journals. And so the
11 staff feel it's kind of challenging to really support
12 their statement or they just are like a (indiscernible)
13 because we are not required to use the weight of the
14 evidence and asserts. (phonetic) And so if there's any
15 tape to advise on those kinds of things?

16 PANEL CO-CHAIR MORAN: Yeah. That's something
17 I see a lot. And I actually have a lot of trouble with
18 that, trying to figure out which and where. Benchmarking
19 is very helpful, so if there's a lot of people looking at
20 the same chemical, being able to see what all the sources
21 are. Obviously, your own literature review is important.

22 And then, really, if it's a critical -- so not
23 every factor is going to -- not every relevant -- in all
24 of the data that you're going to get not everything is
25 going to be super-important in making the decision, so

1 focusing in on those that are. But this is a real
2 challenge. Then if it's a really important endpoint,
3 they are looking at the different studies and actually
4 evaluating their qualities, is often important.

5 So there are I have more than once looked at a
6 whole set of data and there's different reasons that
7 things can be wrong. So and folks here can talk about
8 right or wrong or it's just the best. And there's a lot
9 of different approaches.

10 The USDA ARS came up with a methodology for
11 reviewing various studies and an approach for doing that.
12 The EPA's ECOTOX Database, they also have a way of
13 deciding if studies are good or bad. And of course,
14 there's very -- this is another one. I keep looking at
15 Elaine, because I know she knows more about this than I
16 do -- but it's definitely a struggle.

17 ACTING DIRECTOR WILLIAMS: Yeah, if I could
18 chime in on that, which is we've been talking a lot in
19 the program about systematic review. And one of the
20 things that's so important for a systematic review is to
21 really decide what's the data quality of a particular
22 citation. And so I think we're going to continue that
23 discussion within the program with some of the experts
24 that have looked into this.

25 For instance, Kris Thayer, who is the head of

1 IRIS will be visiting OEHHA. She's doing essentially a
2 three-week residency starting now. And so she's going to
3 spend some time with Safer Consumer Products and this is
4 a great question to ask her as part of that conversation.

5 Elaine?

6 PANEL MEMBER COHEN-HUBAL: Oh, you know, I
7 guess --

8 PANEL CO-CHAIR MORAN: Go ahead, Elaine. I'm
9 picking on you.

10 PANEL MEMBER COHEN-HUBAL: Okay. I started
11 thinking about too many things at once, I think, because
12 the exposure I think that I always feel like exposure is
13 the weak link. And not just it -- and mostly because it
14 puts me in as an exposure scientist, and I'm not a risk
15 assessor. But I consistently feel very uncomfortable
16 with the way we do exposure assessment. And that it's so
17 data-poor the way that we do it, right? And so in
18 addition to evaluating evidence it's very difficult,
19 right? So in lieu of NHANES and biomonitoring and
20 occurrence information for -- again, a lot of the
21 alternatives may likely be data-poor, right? And
22 thinking about the way that life cycle assessment
23 currently does impact.

24 So of course, there's so many opportunities
25 here to sort of just move the field forward and build

1 capacity and lead the way and all these great things.
2 But in the meantime how you evaluate current evidence, I
3 mean, you can't hold people to a standard based on what's
4 available today and what the tools are today.

5 But I do think, and you didn't ask me about
6 exposure assessment, but I do think it's going to be
7 really important that at each stage of the chemical
8 product life cycle that there is thought put into what
9 are the exposure scenarios that are most important. And
10 how those may or may not change what that comparison will
11 be for the alternatives and stuff. So reviewing that,
12 it's going to be challenging only because I don't think
13 there are really good standards.

14 But I think that's something again that as long
15 as you're sort of really documenting what you think today
16 is important to be looking for. So if the most important
17 thing to be looking for is that they've gone through that
18 process and that process looks thoughtful, that's
19 reasonable right?

20 But in terms of having some literature to back
21 that up I think it's important. I think there are more
22 and more everyday opportunities where people are doing a
23 lot more work in these areas. And I just continue to
24 believe that it's going to be very hard.

25 To me, the 60 days, when I think about what

1 people in regulatory agencies are currently -- what
2 questions and what kinds of documents they're trying to
3 assess in 60 days and how challenging that is. And then
4 what you're doing is like that order of magnitude in
5 terms of the level of comparisons and information. And I
6 mean it's just 60 days just blows my mind, so yeah, it
7 matters that things are tied to evidence.

8 But at the end of the day the standards for
9 that evidence, I think you'll be moving the field forward
10 if you're able to, as you're moving along and learning in
11 this process, if you're able to say, "We see that you've
12 pointed to where there's a study. It's in vitro." Or
13 you know that it's not traditional, it's not whatever
14 limitations, but there's I think it's going to be really
15 helpful to look at sort of the ranking and things that
16 they do in IRIS for hazard.

17 And where I was saying we're -- I'm thinking
18 about trying to -- I'm not thinking about -- I'm trying
19 to do something similar on exposure for a set of
20 compounds. And I'm seeing so how would you look at the
21 literature to find evidence, to capture evidence of
22 particular exposure pathways or particular compounds?
23 And what does that look like and then how do you evaluate
24 those manuscripts?

25 So, one will look like there's a population and

1 the occurrence in particular exposure media is measured,
2 and serum levels are measured, right? So now you've got
3 like a high level. And assuming that the study design
4 looks good and it's representative of that population,
5 right. So to get to that standard is going to be almost
6 impossible in the literature for almost everything, so
7 then what would the next two, three, four levels look
8 like? And so we're just doing this now and if anybody
9 knows that this has been done before, please let me know,
10 because I would rather borrow. (Laughter.)

11 But anyway I'm not sure I even answered your
12 question, just a lot of meandering thoughts.

13 PANEL CO-CHAIR MORAN: I think it's harder for
14 exposure than it is for more traditional endpoints. I
15 mean, it's just like, yeah.

16 PANEL MEMBER COHEN-HUBAL: And I agree that in
17 many ways it may or may not be as important as the
18 hazard, but because you're moving to looking at the life
19 cycle and looking at this. Again, it's the analysis and
20 the conclusions and the decisions are only going to be as
21 good as the weakest link. And so I just think it's going
22 to be really -- and nothing -- I find it disconcerting
23 when I read risk assessments.

24 And I've been on the -- I work on Health
25 Canada's Chemical Management Program on their Science

1 Committee. And one of the very first things they brought
2 to us was something about uncertainty. And I can't
3 remember it, because what we ended up doing was just
4 changing their question. (Laughter.)

5 Because in my mind nothing unnerves me more
6 when people just say "There's uncertainty here, there's
7 uncertainty there. And it's up here, down there." And
8 they just write it all down. And I don't see how a
9 decision maker can use that information. I mean, to me
10 it is possible to quantify uncertainty even if it's eight
11 orders of magnitude.

12 But I think when people are going to make
13 decisions the most important thing in a decision is that
14 this is the key uncertainty. If we had information there
15 it might change our decision. And I don't know, that's
16 what I would look for. I mean if you get an assessment
17 back and somebody has really been able to nail down,
18 "These are the three key uncertainties. And if we knew
19 more about this, this and this, if we could go measure
20 this, this and this we might come up with a different
21 answer," that would just be a game changer.

22 PANEL CO-CHAIR MORAN: Yeah.

23 You're up, Mike.

24 PANEL MEMBER CARINGELLO: Sure. And I was not
25 racing to put my test there before you. I knew you had

1 been called. It was just I thought of something and I
2 wanted to --

3 But I'm going to echo some of the themes that
4 Elaine was talking about. And I've expressed my dismay
5 over the 60 days, it's a big challenge. And then
6 documenting what you do? I think it's really key with
7 how you assess these AAs that you are very consistent
8 with the different REs. You know, when their AAs come in
9 or however they flow, if it's through a trade
10 association, however, that you're consistent across the
11 board for a priority product, but then for future
12 priority products as well.

13 And just a thought I had based on what Meredith
14 was saying about quality of citations. I really think
15 now is the time if you haven't already done it, and you
16 probably have, but before these AAs come in develop some
17 sort of method where -- because you're going to have a
18 bunch of citations coming in. And you're going to look
19 at each and every one of those and assess the quality, so
20 have a method where in the current set of AAs that are
21 coming in, you're sharing those assessments. Maybe have
22 if one person's done it, not everyone needs to do it.
23 That might shave some time off.

24 But also make sure that you historically keep a
25 record of why you assess that citation that way. So that

1 when someone comes up with that as an alternative 12
2 priority products down the line because there is a
3 similar application, that you don't have to go back and
4 re-review the citation. And you're consistent with how
5 you evaluated it. I just think it's just kind of along
6 Meg's line of tips maybe. We've run into that all the
7 time of, "What did we do? How did we justify that?" And
8 I think it's important.

9 ACTING DIRECTOR WILLIAMS: And I have to give
10 props to staff -- sorry to interrupt -- but because they
11 do spend a lot of time figuring out how to document
12 things as they go along. Because we make decisions every
13 step of the way. And trying to, you know, if somebody's
14 not in the room we want them to be able to go back and
15 say just what was the basis for what we did. And so that
16 certainly is built into the chemical product evaluation
17 process for prioritization. And I think we need to adopt
18 that same mindset for the AA review. How are we going to
19 document those things? What systems can we put in place?

20 PANEL MEMBER COHEN-HUBAL: I was just going to
21 say this is where your time with Kris Thayer could be a
22 game changer. I don't know what your internal sort of IT
23 looks like for being able to capture and really easily
24 document and access this kind of stuff, but that that's
25 what they really spent a huge amount of time on it in the

1 last couple of years. And I don't see how you're going
2 to do this consistently and well and efficiently and feel
3 really, really good. And have your regulated community
4 feel really good if these kinds of tools aren't brought
5 in to your program.

6 PANEL CO-CHAIR MORAN: Right. And I think a
7 lot of us have the experience where there's, as certain
8 decisions come to down to a small array of studies, they
9 keep reappearing, I keep seeing the same things and the
10 same flawed studies cited over and over again. There's
11 one that drives me crazy that's about zinc and run-off
12 and it's near a hazardous waste incinerator. So there's
13 the time, more zinc and the run-off from the routes there
14 because of the air duct position in the area. And so
15 it's completely flawed. And people misunderstand that,
16 because it's not clear in the paper. You have to kind of
17 pull the thread on it, "Why is this paper different than
18 all the other ones?"

19 And once your staff have done that then you'll
20 get that. And you'll keep seeing these same set of
21 studies over and over again. And to the extent that you
22 can clarify that and even clarify that with the industry
23 if folks share stuff with you ahead of time, that these
24 studies have some specific flaws and these studies seem
25 to be of higher quality. That's really helpful.

1 So did you want to say something here?

2 ACTING DEP. DIRECTOR PALMER: Well, I was just
3 going to ask Elaine to maybe clarify it, because she had
4 mentioned earlier about this automation of process with
5 reference to literature review. But was that also for
6 decision making?

7 PANEL MEMBER COHEN-HUBAL: There and so and
8 again I'm just starting to learn a little bit about the
9 tools that the IRIS program has brought in and tailored
10 to their processes. And again, they're literally doing
11 this now with each assessment that they're working on.
12 But they're at the point where there's really a "there"
13 there. But they are using it not just to access the
14 literature, and I mean broadly the literature, okay? Not
15 --

16 ACTING DIRECTOR WILLIAMS: Thousands of
17 citations.

18 PANEL MEMBER COHEN-HUBAL: Right. Okay. Not
19 just what's in PubMed, but broad access to literature and
20 gray literature and whatever else. But then they're also
21 using it to document how they select literature and
22 evaluate literature. And then they're also using their
23 systems down the line, that kind of thing down the line
24 that they're using to show how they use things in their
25 assessments and in their decisions. So it's pretty

1 remarkable, I think, where it's going.

2 But then the workflows have some automation to
3 them. And the record-keeping is very clean.

4 ACTING DEP. DIRECTOR PALMER: Great. Thank
5 you. So we'll ask Kris Thayer about the "there, there."
6 (Laughter.)

7 PANEL MEMBER COHEN-HUBAL: So it's lot of work.

8 PANEL CO-CHAIR MORAN: So Meg's had her flag up
9 for a while and then Jack.

10 DR. WHITTAKER: We use the ToxRTool to, which
11 is really simple. ECVAM made it and EPA uses it, so I'm
12 sure Kris Thayer uses it too, to rate studies for
13 reliability. And it's an easy way to keep track too, of
14 when you're going to see the same chemical and multiple
15 people are going to be evaluating it.

16 So I can send over an example of like it filled
17 out for -- we use it also when we pick surrogates -- but
18 it's a freely downloadable Excel workbook. And EPA likes
19 it and I'm sure they can give you feedback on it. You're
20 not always going to need to use it, but it really helps
21 if someone gives you oodles of studies to try and -- or
22 of a million alternatives. And you can only look at a
23 couple of data points at a time, or at least I can. I
24 shouldn't say you. But I need to write it down and see
25 it, so it's a nice little tool to try and assess

1 reliability when you're trying to figure out which
2 alternative is really the best.

3 And you're also -- what's hard for me is the
4 scariest part was seeing an alternative is going to have
5 some type of hazard. And ideally it won't be a Chemical
6 of Concern, but you have to let go that there is nothing
7 that's without -- everything is hazardous. And that
8 that's okay depending on the situation of exposure.

9 I don't know, that was hard for me. I wanted
10 hazard-free and you're never going to get that. Yeah, so
11 I'll send over that.

12 ACTING DEP. DIRECTOR PALMER: Thank you.

13 PANEL MEMBER COHEN-HUBAL: That's a nice little
14 quick tool and it's Excel-based, so you don't have to buy
15 a \$100,000 piece of software.

16 PANEL CO-CHAIR MORAN: Okay. Jack?

17 Thanks Meg.

18 PANEL MEMBER LINARD: Just a quick question, or
19 a comment more. Industry provided a lot of data to ECA,
20 the European Chemicals Agency, but that is going to be
21 held confidential. Will the Department be willing to
22 accept ECA's conclusions without being and having access
23 to those studies, because those studies are being held as
24 business-confidential. Same goes for Health Canada and
25 the Chemical Management Plan.

1 I don't know what your answer is, but I think
2 it's important to be very clear that you will or will not
3 or under what conditions you might accept their
4 conclusions, because it's you're trusting them to do the
5 right thing, I hope.

6 ACTING DIRECTOR WILLIAMS: I'm not going to
7 answer that, because (indiscernible) (Laughter.)

8 PANEL CO-CHAIR MORAN: Yeah, go for it.

9 PANEL MEMBER COHEN-HUBAL: I'm just saying that
10 all I'm going to say is I'm going back to your three
11 pillars. And you're leading the way in building capacity
12 on the opportunity you have to really encourage more open
13 and transparent access to information. And I appreciate
14 that companies have a really important proprietary needs
15 for certain information. But again, your program has
16 some opportunities and on this that's all I'm going to
17 say.

18 PANEL CO-CHAIR MORAN: I'll point out that
19 EPA's Pesticides Office, instead of making the full
20 report public they do a detailed analysis and have a data
21 evaluation record, so it doesn't make the report
22 available for someone to take and submit to some other
23 country. But there's way more transparency on the
24 evaluation than just the result, which is what I've seen
25 with ECA stuff. So there are a variety of approaches out

1 there to provide transparency and the Department really
2 needs to figure that out.

3 Meg, are you wanting to weigh in on this one or
4 is that just still from before?

5 DR. WHITTAKER: Oh, sorry.

6 PANEL CO-CHAIR MORAN: That's okay, I just
7 wanted to check and see.

8 DR. WHITTAKER: I just want to see if you're
9 looking at me. (Laughter.)

10 PANEL CO-CHAIR MORAN: Yeah. I'm starting to
11 get hungry, so --

12 PANEL MEMBER LINARD: And that was the reason
13 for my question is I think you need to decide early on
14 what you are willing to accept or not accept.

15 ACTING DEP. DIRECTOR PALMER: Well, just a
16 reminder that the regulations require that that
17 information be submitted to us on the basis of their AA.

18 PANEL MEMBER LINARD: Right.

19 ACTING DEP. DIRECTOR PALMER: And that we can
20 and will protect CDI. The process, so the responsible
21 entity has some decisions to make about what they want to
22 provide to us. And I think that out of the box we're not
23 going to just say, "Because ECA decided it was okay we're
24 going to say it's okay." It's going to take more than
25 that.

1 PANEL MEMBER LINARD: And really, that's the
2 type of statement I think is important to make it clear.

3 ACTING DEP. DIRECTOR PALMER: I mean, I think -
4 - is that okay?

5 PANEL CO-CHAIR MORAN: I'm fine with that.

6 ACTING DEP. DIRECTOR PALMER: Yeah.

7 PANEL MEMBER LINARD: Because if you're part of
8 the SIEF in Europe and you submitted some data, but that
9 was combined with other data that you saw, but you're not
10 allowed to divulge it.

11 ACTING DEP. DIRECTOR PALMER: Right. And
12 there's a lot of overlap. And there's a lot of good work
13 I'm sure that has been done. But from at least at this
14 point, without looking into it further I'd say, "Then
15 provide us that information or a summary." You know,
16 "Point, give us more." We're not expecting to do the
17 whole.

18 PANEL MEMBER LINARD: Well, that's been a
19 problem from day one is because some of that information
20 isn't yours to give out.

21 ACTING DEP. DIRECTOR PALMER: Okay, understood.

22 PANEL MEMBER COHEN-HUBAL: It is a challenge
23 for ECA definitely.

24 PANEL MEMBER LINARD: And it's a challenge for
25 EPA too. The data is there and they can't get it. And

1 they don't want to make -- just accept ECA's opinion
2 carte blanche.

3 PANEL MEMBER COHEN-HUBAL: Although EPA does
4 similar things too sometimes.

5 PANEL CO-CHAIR MORAN: Yeah.

6 PANEL MEMBER LINARD: We know.

7 PANEL MEMBER COHEN-HUBAL: Just saying. We're
8 all --

9 ACTING DIRECTOR WILLIAMS: But EPA is going to
10 share so much under TSCA since their new state CBI
11 sharing provisions, right? (Laughter.) I wonder why
12 everyone's laughing?

13 PANEL CO-CHAIR MORAN: So, a new topic, are
14 there other questions that staff have for the panel?
15 We've talked about a bunch of things. But there are
16 other things that people have raised and just we want to
17 speak up.

18 MS. ROMERO-FISHBACK: I had a quick question.

19 ACTING DIRECTOR WILLIAMS: You need to say your name.

20 (Overlapping colloquy.)

21 ACTING DEP. DIRECTOR PALMER: Yeah, Come up
22 here.

23 MS. ROMERO-FISHBACK: Okay. Sorry, I didn't --
24 my name is Michelle. And I had a question for Dr.
25 Whittaker, because I felt your work is really

1 fascinating. And my question, excuse me, goes towards
2 how do you handle the data gaps on your AAs? And how do
3 you, if you were to do it quantitatively, how do you
4 compare it or if there is any comparison with
5 uncertainty? Because I'm aware for like risk assessment
6 you can put in with certain factors, you can multiply,
7 you can do some sort of quantitatively.

8 But for AAs it's just sort of been lingering in
9 my mind like well, you have a data gap. And maybe some
10 of those smaller companies may not have access to like
11 some sort of sophisticated modeling. Or maybe they don't
12 even have contrasting studies or something that they can
13 pull off. How would you, in your experience, have
14 managed that?

15 DR. WHITTAKER: Well, we follow -- OECD has
16 really good guidelines on how to address data gaps and we
17 use a combination of approaches. So now it's called NAMS
18 now. So sometimes someone will be doing Read-Across or
19 they'll hire a consultant to just do -- a lot of people
20 don't know how to use QSAR Toolbox, because it really is
21 not user-friendly. Not to scare you. If you're going to
22 use it you should try and get, I would recommend, funding
23 to get to Barcelona for a 40-hour course. And you will
24 leave knowing how to use it. It's tough, but it's -- so
25 you'll use it.

1 The person should be using a combination of
2 approaches. And what I like to see is I'll use a couple
3 of different models and a couple of different approaches.
4 And I'll look for consistency.

5 Almost any endpoint can be addressed using a
6 combination of techniques. It's very unusual now where
7 someone just says, "I guess I don't know." Yeah, there's
8 uncertainty. And if you're pulling from that a very
9 close surrogate and you can -- there are techniques.
10 Toolbox has it for example where it's called the Tanimoto
11 coefficient to look at structural similarity. And once
12 you learn how to use those tools it's not perfect, but
13 you can pull a chemist in who will laugh. I mean, I'll
14 say, "This is a close surrogate. The QSAR Model, it just
15 tells me so." Me and Jen Tennaro (phonetic) will start
16 laughing. She'll say, "Go back and pick up your
17 chemistry book. You're so wrong."

18 So it's really a lot of judgment and you just
19 have to -- you know, the people submitting to you should
20 be transparent. And they're obviously going to try and
21 advocate that it's a strong surrogate. But if you see
22 lots of data gaps and they say, "Well, we just don't know
23 if something is reproductively or developmentally toxic,"
24 there are really tools out there that -- they're not
25 perfect, but it's a good start. And I think they just

1 have to be -- you have to be transparent with them and
2 say, "Well, go back to the drawing board."

3 Like I review MCPs for Oregon and those are
4 contaminants that are contained in children's products.
5 And it was normal initially to say, "Well, can you go
6 back and just look at that a little bit more?" and "Are
7 you sure? Did you look at that?" Or "Here are some
8 tools you can use." Most people just aren't familiar
9 with the tools. And so it was normal initially to have
10 some iterations with submitters who would just not know
11 how to address certain endpoints.

12 It was very unusual if someone comes in and
13 they say, "We've addressed every single endpoint in that
14 checklist for you. And it's perfect." I would really be
15 impressed and wonder is that really true. So you will
16 see some.

17 And then they'll think that if they don't talk
18 about it that it's not a data gap. That's another funny
19 thing I see all the time. That's like the beauty of when
20 Design for the Environment created the famous benchmark
21 table that we've all borrowed from. And it really lays
22 bare, which endpoints aren't addressed. Still not super-
23 strong on -- I got tell you, as Kelly will say, "On
24 certain environmental endpoints." But those are harder
25 admittedly. You're not going to know if something is

1 going to hurt a honeybee versus a bumblebee often.

2 But you're dealing with methylene chloride
3 that's a carcinogen. And the alternatives are most
4 likely going to have a data set that will address the
5 standard hazard endpoints.

6 I don't know, Kelly, if you have some other
7 input on that. But for a lot of the standard hazard
8 endpoints I feel fairly comfortable with the NAM
9 technologies, or techniques rather, that exist to address
10 those endpoints. It's not perfect though.

11 PANEL CO-CHAIR MORAN: Yeah, see I don't have -
12 - I've been looking into it but I'm not going to claim
13 I'm an expert in any of the predictive methods. What
14 I've been watching is that EPA's Pesticides Office is
15 using the predictive methods to fill data gaps in
16 environmental fate and chemistry. And they've been doing
17 that for quite a while now, so that they at least have a
18 sense of where does this fall?

19 They are starting to use the predictive methods
20 for aquatic predictions at QSAR and that's --they're
21 confident enough to be using it. I think the agency
22 really needs to make its independent judgment there. And
23 I know that you all have been looking into these methods
24 or having conversations about them. And I'm very
25 intrigued by what Meg has to say about this. I don't

1 know if others want to weigh in on that particular
2 question. This is a hard question.

3 MS. ROMERO-FISHBACK: Oh.

4 PANEL CO-CHAIR MORAN: Yeah, this is a good
5 question.

6 MS. ROMERO-FISHBACK: Thank you.

7 DR. WHITTAKER: And I think for some tests,
8 testing the whole formulation like a biodegradation test,
9 the test methods that are out there aren't super-
10 expensive to do. So if someone wants to say, "I've got a
11 mixture. And this is I've got a paint-stripper
12 formulation," they can run and go do the actual
13 biodegradation tests and run to a laboratory that can do
14 that to address those types of questions fairly without
15 breaking their bank.

16 Once they get to, "Well, this is really the
17 alternative we want," they are not going to run, most
18 people won't run and test 20 things at a testing lab.
19 But once they get to the point of, "This really looks
20 good" then that's when I've seen clients go and they go
21 to a lab and they'll have those tests run. And then
22 ideally demonstrate "Wow, this is a really good mixture
23 or chemical or formulation. And we can demonstrate that
24 it's going to biodegrade and it's not aquatically toxic,
25 you know, different trophic levels." But most people

1 want to do that after they are pretty confident, so they
2 don't waste the money.

3 PANEL CO-CHAIR MORAN: So other questions that
4 the staff have?

5 DR. WHITTAKER: That's a hot seat. (Laughter._

6 MS. GRANT: Thanks.

7 PANEL CO-CHAIR MORAN: Yes. It's a hot day.

8 MS. GRANT: I'm Kelly Grant. And Meg, I kind
9 of wanted to follow up with you in terms of our
10 regulations don't allow us to -- oh, sorry -- don't
11 require the RES to generate new data. How does that fit
12 in with modeling and NAMS data that aren't so onerous to
13 generate, but might still be considered new data?

14 DR. WHITTAKER: Oh, interesting if it's new
15 data. Hmm.

16 Well, NAMS will be an important part of helping
17 the submitter answer the question of is something safer?
18 And it shouldn't break their bank to use free models.
19 You're not saying they have to use DEREK, which costs an
20 arm and a leg to make a prediction. So I don't think
21 you're going to get too much feedback from the use of
22 free models. And would that be considered new data?

23 PANEL CO-CHAIR MORAN: Yeah.

24 DR. WHITTAKER: That's a good question.

25 PANEL MEMBER COHEN-HUBAL: You know, see, I

1 think it's really an odd thing when model output is
2 considered data. I mean, I don't know. My background is
3 engineering and modeling. And I just don't -- we post to
4 the Chemistry Dashboard exposure data, which is modeled
5 with a -- they are using the term commonly modeled data,
6 but it's not. It's modeled output. There's parameters,
7 some of the parameters -- even some of the parameters are
8 wrong. So I just hope your program doesn't have to call
9 model output "new data." That would be discouraging.

10 PANEL CO-CHAIR MORAN: So your advice is -- and
11 I think that's a common experience.

12 PANEL MEMBER COHEN-HUBAL: My advice is that
13 data -- and my advice is that if you're not measuring it
14 -- I'm not saying it's not information. Modeling is a
15 really important way of using available information and
16 understanding of physics and chemistry and other
17 behaviors and principles to take whatever measured
18 information is out there and interpret and use it and
19 extrapolate it and extend it. But I just, and maybe I
20 don't know, maybe I'm just wrong, but to me model output
21 is not new data.

22 ACTING DEP. DIRECTOR PALMER: Just a comment we
23 don't require people generate new data, but people can.

24 PANEL MEMBER COHEN-HUBAL: Right.

25 ACTING DEP. DIRECTOR PALMER: And I think that

1 the tradeoff that the responsible entities are going to
2 have to evaluate, particularly for something that's low-
3 cost and easy to do, is if you choose not to do that then
4 you're throwing yourself on the mercy of our discretion
5 and understanding.

6 PANEL MEMBER COHEN-HUBAL: That's right.

7 ACTING DEP. DIRECTOR PALMER: And that's, I
8 would argue, probably not the best approach to tell your
9 story.

10 PANEL CO-CHAIR MORAN: So that's a good example
11 of one of the ways that EPA is using it's predict tools
12 is to justify saying, "Well we could use this number," or
13 "You could get a better number and we can make a better
14 decision." So oftentimes the number they will propose to
15 use is pretty conservative, so the risk would be higher.
16 And so they are basically encouraging manufacturers to
17 invest in the testing. So while you're not requiring it,
18 that your approach to how you're filling the gaps
19 actually makes a difference.

20 And always it's "Does this matter? Is this the
21 most important thing for decision making? Is it really
22 the thing that's going to change where you're headed?"

23 So other questions from staff?

24 MS. GROSS: I don't think I need to go to the
25 table, but --

1 (Off mic colloquy.)

2 PANEL CO-CHAIR MORAN: Sorry, I think Meg, is

3 that up again?

4 DR. WHITTAKER: Oh, well it'll wait and then

5 I'll help you (indiscernible)

6 PANEL CO-CHAIR MORAN: Okay, oh sorry. I

7 missed that.

8 MS. GROSS: One of the things that I can just

9 list --

10 ACTING DIRECTOR WILLIAMS: And you are --

11 MS. GROSS: I'm Anna Gross, sorry.

12 PANEL CO-CHAIR MORAN: Welcome, Anna. Thank

13 you.

14 MS. GROSS: One of the things I think is

15 supposed to kind of define this program is like really

16 this emphasis on life cycle thinking. And I think a lot

17 of this discussion seems to be kind of a comparative risk

18 assessment that we're kind of envisioning and talking

19 about. And I don't think that's exactly it. And I am

20 concerned as someone who is not super-familiar with the

21 rest of the life cycle analysis part of it, you know, not

22 giving too much weight to one sector of the type of

23 analysis that we're most familiar with and that we will

24 likely have data even if there are data gaps there.

25 There's this whole other sector of emissions and the

1 whole rest of the supply chain that companies might,
2 probably don't have access to a lot of that data and
3 won't be able to provide.

4 And how are we not just -- you know, it's one
5 thing to have a regrettable substitute that has similar
6 toxicological properties and is chemically similar. And
7 you can say like "Don't use certain BPA alternatives,
8 because they're similar." But it's another thing if
9 something is lighting up a whole other sector of the life
10 cycle, how do we look out for that? That's my question.

11 PANEL CO-CHAIR MORAN: I'm wishing Julie
12 (phonetic) were here. Meg, are you on this or can we
13 hold out for a minute?

14 DR. WHITTAKER: Oh, I can hold out. Oh, yeah.
15 I just had another one issue that is about the last.

16 PANEL CO-CHAIR MORAN: We'll come back, and my
17 apologies. Ann looks like she wants to weigh in here.

18 PANEL MEMBER BLAKE: I'm my formulating my
19 thoughts on the fly like you have. That's a very tricky
20 one and it's another like functional use, it's going to
21 be tricky to think about in the abstract. But I think --
22 where do I go from here?

23 When you look at a set of alternatives I
24 suspect that they'll fall into not more than two or three
25 clusters of the way people are approaching the same

1 challenge. And they will light up the same part of the
2 supply chain. I don't know how you look out for it,
3 except just I think go back to our recommendation earlier
4 that many of us repeated, to get to know the product
5 category really well. And look at the alternatives and
6 where they're likely to light up the supply chain.

7 So I'm thinking about alternatives to bleach
8 for example that we said that they were safer for their
9 application. And then found out that it lit up a totally
10 different part of the supply chain. We didn't know that
11 initially when we redid that analysis.

12 So I appreciate your concern. I'm really
13 encouraged that you're thinking about that already. I
14 think that that's already, that mindset, is opening you
15 up to looking for it, so you probably will. You're
16 probably better prepared to find that hot spot elsewhere
17 in this project. And you've also got an multi-
18 disciplinary team, so you're going to have other folks
19 with input on where that might happen.

20 MS. GROSS: All right.

21 PANEL CO-CHAIR MORAN: This is a really good
22 question.

23 Meredith, Elaine, and we're coming back to Meg
24 later.

25 ACTING DIRECTOR WILLIAMS: So I cannot believe

1 you didn't just immediately say "conceptual model." What
2 is the world coming to?

3 So I mean we've had a lot of discussion that
4 you have of course not been privy to about the importance
5 of using conceptual models to really map out the
6 differences and to help with the identification of the
7 relevant factors for each of the alternatives. And this
8 is where I think it's one way to get to those
9 differentiators and the differential factors.

10 MS. GROSS: Right. But how -- so some of the
11 relevant factors like I think we all on our team kind of
12 have some questions about the relevant factors, because
13 sometimes you can't know a factor is relevant until you
14 look at it more closely. And so it might be hard to
15 screen out exactly what's relevant. And if we're not
16 that's -- yeah.

17 PANEL CO-CHAIR MORAN: Yeah. That's it. I
18 think Meredith -- she's kind of pointing at me, because
19 I've been talking a lot about conceptual models. And I
20 had wished that the regs required conceptual models,
21 because they're so important for the picture. And what
22 you're getting at is actually part of what I'm getting at
23 when I say what's missing? That that's the hardest part
24 of the review, so your question is so on point, because
25 you're having to say it's very common for people to be

1 missing important parts in the life cycle thinking.
2 Because they are so focused on doing things that are the
3 kinds of things we're talking about.

4 So that's why I'm actually super-glad you came
5 to the table and brought this to the conversation. I
6 don't think we're going to have perfect -- we don't have
7 perfect answers but trying to pull that thread and what
8 is going on in each of these areas? And I know you all
9 are doing your homework and thinking about the
10 alternatives now, so you have probably have already
11 thought about it and recognized that some alternatives
12 are going to light up some additional things.

13 And getting the relevant factors will tell you
14 there's some different relevant factors for these kinds
15 of alternatives, because of the life cycle thinking that
16 we're doing. That's the endgame. I wish I could tell
17 you something better than that.

18 PANEL MEMBER BLAKE: So can I add to that?

19 PANEL CO-CHAIR MORAN: So quickly and then
20 Elaine.

21 PANEL MEMBER BLAKE: Yes. Yeah. Just keep in
22 mind it's going to be an iterative process, so you don't
23 have to get it right the first time.

24 MS. GROSS: Right.

25 PANEL CO-CHAIR MORAN: Yeah.

1 PANEL MEMBER COHEN-HUBAL: So I, of course, was
2 going to say, conceptual model problem formulation.

3 But I think the other point that may be worth
4 just sort of thinking about is because economics is a
5 piece of this too, is that many of the upstream factors,
6 upstream to the manufacture of the alternative or to
7 sourcing the alternative or something, I don't think
8 that's the major contribution of this program. And I
9 could be wrong, but to me some of those things come out
10 in the economics, that if something is going to require
11 more resources to produce that there's not going to be
12 the incentive for the manufacturer to make that
13 alternative choice.

14 But the downstream, including all the way to
15 disposal, recycling, disposal and stuff, I think those
16 are going to be really places where this program
17 contributes a lot. And where there isn't any economic
18 drivers there's less economic drivers right now for
19 addressing those issues around product safety. So I do
20 think it's okay for the program to -- I don't know in the
21 regs what's okay, but in my mind in terms of the sort of
22 goals of the program I think it would be okay to sort of
23 if there's a submission and they've kind of laid out that
24 conceptually these are the steps, but here's the ones
25 that matter the most or for the comparison that this

1 program should be evaluating, I think it won't seem as
2 intractable as well how do you compare everything to
3 everything?

4 PANEL CO-CHAIR MORAN: But a good example of
5 this is just in the methylene chloride context. So
6 methylene chloride stripper, if you have leftover
7 solution it's a hazardous waste. But if it's an aqueous-
8 based stripper you might want to pour it down the drain
9 even if you've stripped a lead-contained paint.

10 PANEL MEMBER COHEN-HUBAL: Right. And that's
11 all downstream --

12 PANEL CO-CHAIR MORAN: -- and you've got the
13 lead in there.

14 PANEL MEMBER COHEN-HUBAL: -- of use. So
15 that's really important, I think, for this program.

16 PANEL CO-CHAIR MORAN: Yeah. And that's an
17 example of what you're thinking about. So then we're
18 bringing a whole new set of things. And that's why the
19 conceptual model is important, because you're thinking
20 through all of those various pathways. But that brings
21 in a new endpoint. Now you're actually taking something
22 from the product and you're putting it into a new medium.
23 So that's a hard one.

24 I don't think you're going to be perfect on
25 this stuff the first time you review AAs. But I think

1 that you guys have the capacity to see way more than the
2 little tiny example I just gave you.

3 MS. GROSS: Okay.

4 PANEL CO-CHAIR MORAN: So Meg's very patiently
5 waiting. Sorry about that.

6 DR. WHITTAKER: It would be really neat if DTSC
7 would consider co-hosting a Sustainable Futures Workshop.
8 It's a lot easier to teach people how to use some of the
9 easier predictive models than life cycle assessment. You
10 can't teach, in my opinion, life cycle or even thinking,
11 intense thinking, in a two-day workshop. And I know EPA
12 was looking for sponsors. And most of my staff and I
13 have taken it. And by the time you leave you'll know how
14 to use it. You'll know how to make sure you've got your
15 logKOW, which is really important for predicting aquatic
16 toxicity or bio-concentration -- or biodegradation,
17 excuse me.

18 And I don't think -- I'm sure it sounds like
19 you're best buds with all the people at EPA, so it's
20 (indiscernible) I believe it's Cynthia McOliver now,
21 Kelly Mayo Bean left, but that would be really neat.

22 And the people who have to give you AAs, they
23 haven't had a training for a couple of years, would
24 benefit from the training and give you a better quality
25 product, so that you don't have to say, "Well, you've

1 modeled all those, but you've left out -- you have to
2 input logKOW or these are not reliable predictions." So
3 you'll get a better-quality work product, so it'd be
4 worth the investment in my opinion. I've enjoyed the
5 training.

6 PANEL MEMBER COHEN-HUBAL: Are you going to
7 post all these training recommendations?

8 DR. WHITTAKER: No, I don't want to get in
9 trouble, so but these other ones are really good too.
10 But I think the Sustainable Futures is nice.

11 PANEL CO-CHAIR MORAN: All right. So I want to
12 go back to Tony and Xiaoying and just see if there's
13 anything else. We've got a couple of minutes left.
14 There's one more question I want to ask before we close
15 and just see is there anything else here that you want to
16 say or ask?

17 MR. LUAN: Oh, I don't have any. Does anybody
18 else have any? No.

19 PANEL CO-CHAIR MORAN: All right. So the one -
20 - thank you and thank everybody on this.

21 I wanted to circle back around to the metrics
22 thing. So Art raised something this morning about the
23 economic benefits to the state of this program. And I
24 just wanted to check in. We were yesterday kind of
25 brainstorming a little bit of the other ancillary

1 benefits and impacts in the program. And that was
2 something that hadn't come up. But then Art raised it
3 this morning, so I just wanted to see if anybody had any
4 thoughts about that. I don't know if there's a metric
5 that goes with that.

6 All right, Ann?

7 PANEL MEMBER BLAKE: So we've been talking in
8 other context about quantifying health costs and health
9 impacts, so this is a very live conversation. And I'm
10 happy to talk about that further, but it's very much in
11 flux.

12 So how do we start pending the economic costs
13 of health? And then as we've talked about yesterday,
14 it's really hard to allocate prevention to that outcome.
15 But anyway, at least indicate these -- this is what our -
16 - the status quo of what it was costing us with specific
17 chemical exposures. And then saying and somehow figuring
18 out how this program is impacting that.

19 Because one of the things that we have not, we
20 collectively as a society have not articulated well -- as
21 you all know I'm preaching to the choir here -- is that
22 we have not articulated the externalized costs of the
23 status quo now and the health and the environmental
24 impacts and because those are hard to measure. So I mean
25 I would love to work with the economists that you've

1 hired as well to figure out better metrics on that. But
2 that's one approach to think about this, is quantifying
3 health benefits.

4 PANEL CO-CHAIR MORAN: Well, I'm also thinking
5 about the stimulating innovation and creating market
6 opportunities.

7 PANEL MEMBER BLAKE: Absolutely, yes.

8 PANEL CO-CHAIR MORAN: Or actually advantaging
9 companies in California who are serving a California
10 market.

11 PANEL MEMBER BLAKE: Yeah. Yeah, both sides to
12 that, yes.

13 ACTING DIRECTOR WILLIAMS: I kind of wanted to
14 ask Ann, are you talking about willingness to pay? Or
15 are you thinking specifically about -- I mean, is that
16 embedded in what you're saying?

17 PANEL MEMBER BLAKE: A willingness to pay? No.

18 ACTING DIRECTOR WILLIAMS: It isn't. Okay.

19 PANEL MEMBER BLAKE: No. It's quantifying what
20 is it costing us in the health sector.

21 ACTING DIRECTOR WILLIAMS: Okay, because people
22 are flipping that around more and more.

23 PANEL MEMBER BLAKE: I would like to have that
24 conversation.

25 PANEL CO-CHAIR MORAN: There's some costs are

1 easier than others, disposal costs are easier to deal
2 with than a lot of other things.

3 ACTING DIRECTOR WILLIAMS: You're right. But
4 the willingness to pay is, "How much are we willing to
5 pay to have a better health outcome?"

6 PANEL MEMBER BLAKE: I see.

7 ACTING DIRECTOR WILLIAMS: "To have a safer
8 product, to have a better environment." And when you ask
9 people questions in those ways you get to different
10 answers. And you actually can monetize that way, so
11 another area where Tracey Woodruff has been active.

12 PANEL MEMBER BLAKE: Yeah.

13 PANEL CO-CHAIR MORAN: Do you want to say
14 something, Elaine?

15 PANEL MEMBER COHEN-HUBAL: So we do have
16 examples where some of these things, you know, the health
17 benefit and costs for air pollution reduction. I mean,
18 air pollution is always on of these things where they're
19 so much easier to do. So that's a good place to draw
20 examples. I know we had one recently where that was
21 done. There's a couple of tools, and I'm blanking on
22 them now, at EPA where they've done some of that kind of
23 analysis. But everything's easier on air pollution, is
24 all I've get to say.

25 PANEL CO-CHAIR MORAN: So if nothing else, if

1 there are ever a case study example comes forth, that
2 that is something it seems that would be part of the
3 conversation around the success of the program.

4 MR. LUAN: Can I get that?

5 PANEL CO-CHAIR MORAN: Yes, okay.

6 ACTING DEP. DIRECTOR PALMER: I think yeah, we
7 had -- I can't remember when, but the last time we had an
8 expert from EPA on monetizing air, the cost of air
9 pollution and pesticide issues was quite interesting.
10 And so I'm wondering if we have this desire and need to
11 monetize some impacts?

12 On the other end of the spectrum we'd like to
13 be looking at how we can influence innovation. And so it
14 might be timely to get, perhaps, Marty Mulvihill or
15 someone back to talk to us about the markets and our
16 decision making. And what factors are employed by people
17 who make the decisions in developing products. And maybe
18 some of you have thoughts about that.

19 But back to the shadow vs. shape, we're a small
20 group. We can't change the world overnight, but I think
21 this concept of expanding people's view, using the market
22 as a tool for positive change is something that we'd be
23 curious about, too.

24 PANEL MEMBER COHEN-HUBAL: Me too. And for me
25 that kind of goes back also to just whether it's

1 innovation or even businesses just using their success in
2 the program as a marketing tool. Or as in their own
3 bookkeeping on like sort of some of these ESG indicators
4 where that starts to show up, that chemicals and safety
5 of products beyond the current indicators, which are
6 mostly focused on resource use and impacts on those ends.
7 But that kind of thing, again I don't know how that would
8 be tracked or whether that'll be something that happens.
9 But it would be a way of at least showing that the
10 business, that this program has influenced how businesses
11 think about that as having value.

12 PANEL CO-CHAIR MORAN: All right. So we've
13 reached the witching hour, 11:45 a.m. And it's time for
14 us to wrap up the meeting. We've covered a pretty full
15 array of topics in pretty rapid-fire fashion. It was, I
16 thought, a pretty amazing discussion the last couple
17 days. And you guys are probably as mentally tired as I
18 am at this point. So I wanted to move into the
19 opportunity to close this.

20 I know rather than attempt to reiterate all the
21 highlights of everything we've said I'll remind everyone
22 that the staff have been taking copious notes. There's
23 actually a recording and a transcript being generated
24 from the meeting. So there's lots of different ways that
25 folks will be able to access the conversation and what we

1 did.

2 And again I encourage the staff if there's
3 specific questions like means and references and things
4 like that the panelists have, I think, been quite willing
5 to, and are allowed to individually interact with the
6 staff to follow up on any of those items, so I'd
7 encourage panelists to be responsive if the staff reach
8 out.

9 And particularly on this last question, it's a
10 pretty short time before they're going to start getting
11 the AAs. So don't be surprised if you get some
12 questions. And I think and I'm pretty confident that the
13 folks in the room and the folks not in the room will be
14 very happy to help out the staff. So I just want to
15 reiterate that to the staff team that we're your science
16 advisors at the meeting. But individually if staff have
17 questions that are appropriate to ask a science advisor.
18 It is the role of the science advisor panel to provide
19 information to support the team.

20 But personally, I've got to say the discussion
21 here has increased my confidence that the staff is
22 prepared to handle these things. And I know we've had
23 many discussions where the science advisory panel acts as
24 if we're saying new things. And it was all the stuff
25 that the staff already knew ahead and had already been

1 thinking about. But this one in particular really made
2 me feel like that the staff had really done their
3 homework. And the fact you're asking this, the good
4 questions, and then we're responding with things you've
5 already been working towards managing just gives me tons
6 of confidence that you're ready for those July
7 submittals.

8 So before we go to the final closing remarks
9 from Art and me, I'd like to offer Meredith a chance to
10 say a few words here.

11 ACTING DIRECTOR WILLIAMS: Well, we'll start
12 with a round of thank yous. Today is Admin Professionals
13 Day and they are not in the room, our administrative
14 professionals who (indiscernible). I think we would be
15 remiss if we didn't take a second or a minute to just
16 appreciate how much they've done with the logistics in
17 making the trains run on time, and just arranging
18 everything. And I used to be very hands-on. And now I
19 just have no idea what's going on and yet everything
20 works out just fine, so that really speaks to staff. And
21 it speaks to the admin team in particular.

22 I do want to thank staff for really picking up
23 the ball and running with it this meeting. And Anne
24 Cooper, you've really helped coordinate a lot of the
25 internal discussion of staff about the concepts that we

1 put forth and discussed. And we're just flat-out proud
2 of the work that was done by staff to do all the thinking
3 to get us to this conversation.

4 I know you are all tired, however, I wish we
5 could keep going. (Laughter.) That's just me. When
6 Kelly said, "Oh, I'm so glad you can make the time," I'm
7 like, "Oh, a vacation." So I just enjoy these meetings
8 so much. I'm already looking forward to the next one to
9 be honest. My mind is thinking of ideas and I'm really
10 excited about it.

11 I will tell you we have made a commitment to do
12 a Prioritization Lookback at the next meeting, in the
13 fall meeting. Based on the Green Chemistry Report, we're
14 going to take a look at -- by that time we'll have quite
15 a number of products under our belt in terms of having
16 proposed them and we'll talk about some of the approaches
17 we've used and what we've learned. And where we think
18 the opportunities are to do double-down on certain things
19 and to tweak our processes. And we'll give you a window
20 into some of that activity. And I'm really looking
21 forward to that discussion.

22 And as always, just thank you for the guidance.
23 Again, as Karl indicated when he gave you the program
24 update, we feel as though we're up another step up in
25 terms of the quality of the program, the productivity of

1 the program, the strength of the staff, you name it.

2 And that wouldn't possible -- not only for your
3 broad science advising and the wealth of experience, but
4 also for your cheerleading. And you're cheerleading not
5 just in the room, but as you're out in the world talking
6 to people about the program, as you talk to other folks
7 in government who may wonder what are those SCP people up
8 to?

9 I'm just very grateful for that continued
10 support, so thank you all for getting here, for staying
11 funded and the continued dedication to what we're trying
12 to do here.

13 And our co-chairs in particular are just so
14 steady at the helm, brought us to another good place in
15 terms of challenges. It's very funny now, because
16 sometimes Anne Cooper and I bring a topic forth and we
17 go, "Well, we thought that was going to go better." But
18 we always end up in a good place. And that's because you
19 are so thoughtful in your feedback to us to shape these
20 meetings, so thank you.

21 PANEL CO-CHAIR FONG: And so let me just point
22 out one of the reasons why these meetings go so well, and
23 we get so much out of it, it's because of the tremendous
24 amount of hard work that Anne Cooper and the staff put
25 into preparation. It's just amazing. So I think it

1 should be obvious from the materials that you've received
2 prior to the meeting how much work goes into the
3 preparations.

4 So, Anne Cooper. (Applause.)

5 MS. COOPER DOHERTY: Well, it's thanks to the
6 team that's helping me, Kelly and (indiscernible)

7 PANEL CO-CHAIR FONG: Yeah, could you guys
8 stand up please?

9 MS. COOPER DOHERTY: Two of them are here. You two,
10 come up. Just at least wave. (Applause.) And
11 especially Anna and (indiscernible) they all helped put
12 together this.

13 ACTING DEP. DIRECTOR PALMER: And just a shout-out
14 to Baoku, who makes it all work here on the technical
15 side of it. We've been in this building since 2001. And
16 we continue to have challenges in this world, but Baoku
17 makes it all work, so thank you. (Applause.)

18 PANEL CO-CHAIR MORAN: So and I wanted to just,
19 again, thank everyone here. The panel members were very
20 prepared. I think your comments were really well
21 informed by a lot of thinking and staying on top of and
22 tracking the program, so your experience here as well as
23 your preparation for the meeting. And I jointly want to
24 be thanking the staff.

25 Today's Earth Day.

1 ACTING DIRECTOR WILLIAMS: It's Earth Day here. It
2 was Earth Day two days ago everywhere else.

3 PANEL CO-CHAIR MORAN: It's Earth Day in California
4 today.

5 ACTING DEP. DIRECTOR PALMER: Every day is Earth
6 Day.

7 PANEL CO-CHAIR MORAN: and I can't think of a better
8 way to spend Earth Day than working to make safer
9 consumer products. And people joke about Earth Day is
10 every day, but for the folks who are here, the folks in
11 the room and the staff who are working on this, every day
12 is Earth Day.

13 What you're going really matters. It's really,
14 really important for our state, for our country. And I
15 thank you for doing that. I thank you for your
16 dedication, I thank you for your quality. I thank you
17 for bringing science to this program and we're behind
18 you. We'll be supporting you through all the next steps
19 in this journey. So thank you very much. This meeting
20 is adjourned.

21 (The meeting of the Green Ribbon Science Panel
22 concluded at 11:54 a.m.)

23
